In *plants*, vegetation. We speak of slow *growth* and rapid *growth*; of early *growth*, late *growth*, and full *growth* The growth of the animal body, the development of its organs, and the supply of waste, are all dependent on the blood, that is, on the ingredients of the blood, so that only those substances can properly be called nutritious, or considered as food, which are capable of conversion into blood. The chief constituents of blood are fibrin and albumen, and these are supplied by vegetables directly, and indirectly by the flesh of herbivorous animals which feed on vegetables. Nutritious food, whether derived from animals or vegetables, contains proteine, which is the source of all the organic azotized constituents of the body. The growth of the young of mammiferous animals is effected by the supply of milk. The caseine of the milk, which is identical in composition with fibrine and albumen, serves the same purpose in the young animal, namely, the supply of blood, the increase and development of the muscular fibre, cellular tissue, nervous matter, and bones, that vegetable and animal food serve in the adult animal. Besides caseine, the milk contains butter (fat), and sugar of milk. These supply carbon and hydrogen, which are expended in the production of animal heat. [*See* NUTRITION.]—2. Criminality; that state of a moral agent which results from his actual commission of a crime or offence, knowing it to be a crime, or violation of law. To constitute guilt there must be a moral agent enjoying freedom of will, and capable of distinguishing between right and wrong, and a wilful or intentional violation of a known law, or rule of duty. The guilt of a person exists, as soon as the crime is committed; but to evince it to others, it must be proved by confession, or conviction in due course of law. the form of a soft chalky stone which in a very moderate heat gives out its water of crystallization, and becomes a very fine white powder, extensively used under the name of plaster of Paris. [*See* PLASTER.] This last is the most common, and is found in great masses near Paris, where it forms the hill of Montmartre, near Aix in Provence, and near Burgos in Spain. It is found in smaller portions in various parts of Europe. Gypsum is found in three geological positions in the crust of the earth; among transition rocks; in the red marl formation; and above the chalk in the tertiary beds. The most interesting gypsums, in a general point of view, are the tertiary or those of the plains or hills of comparatively modern formation. They are characterized by the presence of fossil bones of extinct animals, and a large proportion of carbonate of lime, which gives them the title of limestone gypsums. Such are the gypsums of the environs of Paris. When gypsum occurs without water it is called *anhydrite*, but in its most ordinary state it is combined with water; of this latter there are six sub-species; sparry gypsum or selenite; the foliated granular; the compact, the fibrous; the scaly foliated; the earthy. The plaster stone of the Paris basin, ground and mixed with water, is used as a mortar in building. H

H, is the eighth letter of the English Alphabet. It is properly the representative of the Chaldee, Syriac, and Hebrew ח, which is the eighth letter in those alphabets. Its form is the same as the Greek H *eta.* It is not strictly a vowel, nor an articulation; but the mark of a stronger breathing than that which precedes the utterance of any other letter. It is pronounced with an expiration of breath, which, preceding a vowel, is perceptible by the ear at a considerable distance Thus *harm* and *arm*, *hear* and *ear*, *heat* and *eat*, are distinguished at almost any distance at which the voice can be heard. H is a letter *sui generis*, but as useful in forming and distinguishing words as any other. In our mother tongue, the Anglo-Saxon, and other Teutonic dialects, *h* sometimes represents the L. *c*, and the Gr. κ; as in *horn*, L. *cornu*, Gr. κερας: *hide*, G. *haut*, Sw. *hud*, D. *huid*, Dan. *hud*, L. *cutis;* Sax. *hlinian*, L. *clino*, Gr κλινω, to lean; L. *celo*, to conceal, Sax. *helan*, G. *hehlen*, Dan. *hæler* In Latin, *h* sometimes represents the Greek χ; as in *halo*, Gr χαλαω: *hio*, χαω. In English, *h* is sometimes mute, as in *honour*, *honest;* also when united with *g*, as in *right*, *fight*, *brought.* In *which*, *what*, *who*, *whom*, and some other words in which it follows *w*, it is pronounced before it, *hwich*, *hwat*, &c. As a numeral in Latin, H denotes 200, and with a dash over it H̄ 200,000. As an abbreviation in Latin, H stands for *homo*, *hæres*, *hora*, &c. Dan. and Sw. *hagel;* so called from its rough broken form, from the root of *hack, haggle*.] The small masses of ice or frozen vapour, falling from the clouds in showers or storms. These masses consist of little spherules united, but not all of the same consistence; some being as hard and solid as perfect ice; others soft, like frozen snow. Hailstones assume various figures; some are round, others angular, others pyramidical, others flat, and sometimes they are stellated with six radii, like crystals of snow. Hail occurs chiefly in spring and summer, and is always accompanied with electrical phenomena, and not unfrequently with thunder. It usually precedes storms of rain, sometimes accompanies them; but never, or very rarely, follows them, especially if the rain is of any duration. The time of its continuance is always very short, generally only a few minutes. The usual size of hailstones is about a quarter of an inch in diameter, but they are frequently of much larger dimensions, sometimes even 3 and 4 inches in diameter. Hail storms are very destructive to crops, particularly in hot climates. The phenomena attending the formation and fall of hail are not well understood; but it is supposed that the cold necessary for its formation is produced by the wind; and that when hailstones are formed they are also carried along through the atmosphere by currents of wind, in a direction very oblique to the horizon, by which means they may be kept suspended a sufficient length of time to acquire the dimensions they possess, by congealing the particles of humid vapour with which they successively come in contact. The electricity with which hail is always accompanied, is only the effect of the passage of the particles of water from the liquid to the solid state. Hail-rods, upon the same principle as lightning-rods, have been erected in Germany and Switzerland, with the view of subtracting the superabundant electricity from the clouds, and preventing the formation of hail; but they have not been attended with the success which was expected.

HEAT, *n.* [Sax. *heat*, *hæt*; D. *hitte*; G. *hitze*; L. *æstus*, for *hæstus*, or *cæstus*. *See* the Verb.] 1. Heat, as a cause of sensation, that is, the matter of heat, is considered to be a subtile fluid, contained in a greater or less degree in all bodies. Different bodies require different quantities of heat to raise them to the same temperature, and those that require the largest quantity to raise them to a given temperature, are said to have the greatest *capacity for heat*. In *modern chem.*, it is called *caloric*. A certain degree of heat is essential to animal and vegetable life. Heat is *latent*, when so combined with other matter as not to be perceptible. It is *sensible*, when it is evolved and perceptible. It is the cause of fluidity and evaporation. It penetrates, and expands all bodies, but the expansions

are different in different substances. In general solids expand least by heat; liquids expand more and more rapidly, and air and gases expand most and most rapidly of all. Heat, or caloric, is never found in a separate state, but always in conjunction with matter, and although unequally diffused among bodies, it is always tending to an equilibrium. It may be communicated to surrounding bodies, either by contact or conduction, or by radiation. Its influence at different distances from the place or point whence it emanates, is inversely as the squares of those distances. The sources of heat, or caloric, are the following:—viz., the sun's rays, combustion, percussion, friction, pressure, the mixture of different substances, electricity, and magnetism A knowledge of the laws and effects of heat, is of great importance in the arts and manufactures. [*See* CALORIC.]—*Specific heat*, a term applied to the quantity of thermometric heat required to raise different substances to the same temperature.—2. Heat, as a sensation, is the effect produced on the sentient organs of animals, by the passage of caloric, disengaged from surrounding bodies, to the organs. When we touch or approach a hot body, the caloric or heat passes *from* that body *to* our organs of feeling, and gives the sensation of heat. On the contrary, when we touch a cold body, the caloric passes *from* the hand *to* that body, and causes a sensation of cold. *Note.* This theory of heat seems not to be fully settled —3 Hot air, hot weather; as, the *heat* of the tropical climates.—4. Any accumulation or concentration of the matter of heat or caloric; as, the *heat* of the body; the *heat* of a furnace; a red *heat*; a white *heat*; a welding *heat*.—5. The state of being once heated or hot. Give the iron another *heat*.—6. A violent action unintermitted; a single effort.

With these words coincides the L. *æstus*, for *hæstus*, heat, tide, Gr. *αιθω*, to burn, and the English *haste* and *hoist* are probably of the same family. The primary and literal sense of all these words, is to stir, to rouse, to raise, to agitate, from the action of driving, urging, stimulating, whence Sw. *hetsa*, Dan *hedser*, to excite, to set on dogs. It may be further added, that in W. *cás* is hatred, a *castle*, from the sense of separating; *casau*, to hate; and if this is of the same family, it unites *castle* with the foregoing words. In these words we see the sense of repulsion.] 1. To make hot; to communicate heat to, or cause to be hot; as, to *heat* an oven or a furnace; to *heat* iron.—2. [*See* ERICA.] They inhabit the northern parts of Europe, and a few of the loftiest hills in the south; but their grand habitat is the southern promontory of Africa, where thousands of acres are covered with heaths in incredible numbers, and with hundreds of different species. In Great Britain, heath or heather covers large tracts of waste lands, and is used to thatch houses, to make brooms, and even beds in the Highlands of Scotland. Sheep, goats, and cattle feed upon it, and bees extract finely flavoured honey from the flowers. The ancient Picts are said to have employed the young shoots and flowers for the manufacture of beer. [*See* MENSURATION.] The second serves for the measurement of heights in cases where not only the height of the summit is required, but also that of the slope which leads to it, and this is done by means of the level. [*See* LEVELLING.] The third is accomplished by means of the *barometer*, on the principle that the column of mercury in the barometer descends, as we ascend to the top of elevated objects, the height of the mercury being always proportional to the density of the atmosphere. But in countries where there is an established church, an opinion is deemed *heresy*, when it differs from that of the church. The Scriptures being the standard of faith, any opinion that is repugnant to its doctrines, is *heresy;* but as men differ in the interpretation of Scripture, an opinion deemed *heretical* by one body of Christians, may be deemed orthodox by another. In Scripture and primitive usage, *heresy* meant merely *sect, party*, or the doctrines of a sect, as we now use *denomination* or *persuasion*, implying no reproach.—2. Originally this tribute consisted of military furniture, or of horses and arms, as appears by the laws of Canute, C. 69 But as defined by modern writers, a *heriot* is a customary tribute of goods and chattels, payable to the lord of the fee on the decease of the owner of the land; or a render of the best beast or other movables to the lord on the death of the tenant. There is no such thing as a true human hermaphrodite; the individuals supposed to be so, are always either males with some defect of the organs of generation, giving them a resemblance to those of the female, or *vice versa*. The term is applied also to other animals characterized by a similar formation. Hermaphrodites are divided into *true* and *spurious*, the first comprehending those organized bodies in which there is a real combination of the characteristics of the two sexes; and the second, those in which the combination is only apparent. Hermaphrodites are also natural, or preternatural. The animals in which the organs of the two sexes are naturally combined in the same individual, are confined to the invertebrate division, and are most common in the molluscous and radiate classes. The preternatural kind of hermaphroditism has hitherto been found only in insects and crustaceans. —2. HIEROGLYPH'IC, } cred, and *γλυφω*, to carve.] 1. In *antiquity*, a sacred character; a mystical character or symbol, used in writings and inscriptions, particularly by the Egyptians, as signs of sacred, divine, or supernatural things The hieroglyphics were figures of animals, parts of the human body, mechanical instruments, &c., which contained a meaning known only to kings and priests. It is supposed they were used to veil morality, politics, &c., from vulgar eyes. Hieroglyphics, however, were not so denominated as being exclusively appropriated or confined to compositions connected with religion; they, in fact, constituted a real written language applicable to history and common life, as well as to subjects of a religious or mythological

kind. Hieroglyphics may be considered as the monumental writing of ancient Egypt, and as such were distinguished from the intermediate form of writing called the *hieratic*, which is, for the most part, confined to the papyri; and still more from the *enchorial* or *demotic*, which appears to have been employed for the ordinary purposes of life. There are two kinds of hieroglyphic writing, one of which expresses its meaning by the first elements, or phonetic signs; that is, signs expressive of sound; and the other is symbolic. Of the symbolic, one part expresses its meaning by imitation, a second part, as it were, tropically, and the third is purely allegorical, expressed by a kind of enigmas. Great light has been thrown upon the Egyptian hieroglyphics by the researches of Young and Champollion, but much still remains to be done before that kind of writing can be accurately deciphered. —2. The high-pressure engine is comparatively simple in construction, no condensing apparatus being required; but, on the other hand, its use is attended with a proportionate sacrifice of the mechanical value of the fuel, and with an increased risk of accident, arising from the necessity of employing steam of considerable tension. HO'LY ALLIANCE, *n.* A league formed among certain of the principal sovereigns of Europe, after the defeat of Napoleon at Waterloo; on the proposal, it is said, of the emperor Alexander of Russia. It arose from the religious feeling which was prevalent at that period, of deliverance from French domination, which was considered as a consequence of the French revolution, and Napoleon as an incarnation of evil. The act of this alliance is said to have been sent by Alexander, in his own hand-writing, to the emperor of Austria and the king of Prussia, and signed by them. It consisted of a declaration, that in accordance with the precepts of the Gospel, the principles of justice, charity, and peace should be the basis of their internal administration, and of their international relations, and that the happiness and religious welfare of their subjects should be their great object. All the European sovereigns finally became members of the holy alliance, and it soon became apparent that this alliance was connected with the determination of those sovereigns to support existing governments throughout Europe by the declaration of November, 1819, and to check the liberal spirit then breaking out all over the Continent. Afterwards the Congresses of Troppau, Laybach, and Verona established the character of the alliance, to which the war of France, or rather of the Bourbons, against Spain in 1823, gave additional illustration. Since the secession of England and France the alliance can scarcely be said to have any active existence.

HU'MOUR, *n.* [L. from *humeo*, to be moist; Sans. *ama*, moist.] 1. Moisture; but the word is chiefly used to express the moisture or fluids of animal bodies; as, the *humours* of the eye. But more generally the word is used to express a fluid in its morbid or vitiated state. Hence, in *popular speech*, we often hear it said, the blood is full of *humours*. But the expression is not technical nor correct.—*Aqueous humour of the eye*, a transparent fluid, occupying the space between the crystalline lens and the cornea, both before and behind the pupil.—*Crystalline humour* or *lens*, a small transparent solid body, of a softish consistence, occupying a middle position in the eye, between the aqueous and vitreous humours, and directly behind the pupil. It is of a lenticular form, or with double convex surfaces, and is the principal instrument in refracting the rays of light, so as to form an image on the retina.—*Vitreous humour of the eye*, a fluid contained in the minute cells of a transparent membrane, occupying the greater part of the cavity of the eye, and all the space between the crystalline and the retina.—2. A disease of the skin; cutaneous eruptions.—3. Turn of mind; temper; disposition, or rather a peculiarity of disposition often temporary; so called because the temper of mind has been supposed to depend on the fluids of the body. Hence we say, good *humour*; melancholy *humour*; peevish *humour*. Such *humours*, when temporary, we call freaks, whims, caprice. Thus, a person characterized by good nature may have a fit of *ill humour*; and an ill-natured person may have a fit of *good humour*. So we say, it was the *humour* of the man at the time; it was the *humour* of the multitude.—4. That quality of the imagination which gives to ideas a ludicrous or fantastic turn, and tending to excite laughter or mirth. *Humour* is less poignant and brilliant than *wit*; hence, it is always agreeable. Wit, directed against folly, often offends by its severity; *humour* makes a man ashamed of his follies, without exciting his resentment. *Humour* may be employed solely to raise mirth, and render conversation pleasant, or it may contain a delicate kind of satire.—5. Petulance; peevishness; better expressed by *ill humour*.

> Is my friend all perfection? has he not *humours* to be endured? *South.*

The sick, the infirm, and the aged often require to be *humoured*.—2. To suit; to indulge; to favour by imposing no restraint, and rather contributing to promote by occasional aids. We say, an actor *humours* his part, or the piece.

> It is my part to invent, and that of the musicians to *humour* that invention. *Dryden.*

This climbing perennial is a native of Britain, and is extensively cultivated in several English counties. The fruit strobili are egg-shaped and pendulous: these strobili, after being dried in a kiln, are used extensively in the manufacture of beer and porter. [*See* HOP.]

HU'MUS, **HU'MINE**, } *n.* [L. *humus*, soil.] A term synonymous with *mould*. It is a dark brown or black powder, and is obtained in greatest abundance from bog-earth, peat, and turf. When wood is exposed to air and moisture it decays and moulders, and is gradually converted into *humus*. The same substance also exudes from the bark of the elm, and hence it has been termed *ulmine* or *ulmic acid*. It also appears to be contained in the bark of most trees. *Humus*, as it exists in the soil, is a product of the decay of vegetables; it is almost insoluble in water, but is readily soluble in solutions of the alkaline carbonates. It is a compound of carbon, hydrogen, and oxygen, and has been supposed by some chemists to contribute materially to the nutriment of growing plants, by furnishing them with carbon. Liebig, however, has shown that it does not directly furnish carbon to vegetables; but that by slowly and gradually undergoing combustion it yields a constant and steady supply of carbonic acid in moderate quantity, and that this is partly absorbed by the roots, and partly rises into the atmosphere, to be absorbed by the leaves. As *humus* combines with bases, it has been called by Boullay *humic acid*.

HUND'RED, *a.* [Sax. *hund* or *hundred*; Goth. *hund*; D. *honderd*; G. *hundert*; L. *centum*; W. *cant*, a circle, the hoop of a wheel, the rim of any thing, a complete circle or series, a hundred; Corn. *canz*; Arm. *cant*; Ir. *ceantr.* Lye, in his Saxon and Gothic Dictionary, suggests that this word *hund* is a mere termination of the Gothic word for ten; *taihun-taihund*, ten times ten. But this cannot be true, for the word is found in the Celtic as well as Gothic dialects, and in the Arabic *hand*; at least this is probably the same word. The Welsh language exhibits the true sense of the word, which is, a circle, a complete series. Hence W. *cantrev*, a division of a county, or circuit, a *canton*, a hundred. *See* CANTON. The word signifies a circuit, and the sense of *hundred* is secondary. The *centuria* of the Romans, and the *hundred*, a division of a county in England, might have been merely a *division*, and not an exact *hundred* in number.] Denoting the product of ten multiplied by ten, or the number of ten times ten; as, a *hundred* men.

HUND'RED, *n.* A collection, body, or sum, consisting of ten times ten individuals or units; the number 100.—2. A division or part of a county in England, supposed to have originally contained a *hundred* families, or a *hundred* warriors, or a *hundred* manors. [But as the word denotes primarily a *circuit* or *division*, it is not certain that Alfred's divisions had any reference to that number.] Various articles of commerce are sold by the hundred. Deals are sold by the *long hundred*, which is six score. Pales and laths are sold at five score to the hundred, if five feet long, and six score if only three feet long.—*A hundred of lime*, a denomination of measure, in some places equal to 35, in others, as about London, 25 heaped bushels or bags; that is, a hundred pecks.

HUNT'ING, *n.* The act or practice of pursuing wild animals, for catching or killing them. *Hunting*, in a general sense, includes the pursuit both of hairy and of feathered game; but in a narrower sense it is applied only to beasts of venery (of the forest, as the hart, hind, hare, boar, wolf), and of chase (of the field, as the buck, doe, fox, marten, roe). In a rude state of society it is one of the most important employments of mankind, and in a more civilized state it becomes an agreeable amusement, men pursuing chiefly for pleasure in the latter case what they once followed from necessity. *Hunting* is practised in a great variety of ways, according to the object of the persons engaged in it, the nature of the country, and the description of the game. The object may be to obtain a supply of food, to destroy noxious animals, to get possession of useful ones, or some useful animal product, (as furs, skins, &c.,) or merely pleasure and amusement. The pursuit may be conducted by means of other animals, as by dogs, falcons, &c., or the prey may be caught by stratagem, (as by nets, traps, pitfalls,) or destroyed by firearms or other weapons. Hurricanes prevail chiefly in the East and West Indies, the Isle of France, and in some parts of China. A hurricane is distinguished from every other kind of tempest by the extreme violence of the wind, and by its sudden changes; the wind often veering suddenly several points, sometimes a quarter of the circle and even more. Hurricanes appear to have an electric origin; the velocity of the wind exceeds that of a cannon ball, sometimes 300 feet in a second. Corn, vines, sugar canes, forests, houses, every thing is swept away by it. What are called hurricanes in more northern latitudes are only whirlwinds occasioned by the meeting of opposite currents of air.—2. Any violent tempest.

HUS'BAND, *n.* (*s* as *z.*) [The origin of this familiar word has been but indifferently explained by most verbal antiquaries, and left uncertain by all preceding lexicographers. Skinner derives it from A.-S. *hus*, house, and *band*, a tie; q. d. *domûs vinculum*. Sir H. Spelman, in v. *Husbandus*, follows nearly in the same track; while Junius thinks it has a Danish origin; others, a Swedish. Dr. Jamieson, leading us back to our own earlier vernacular, traces the word to a different A.-S. etymon; viz., *buand*, *buende*, pp. of *bu-an*, *by-an*, to dwell in, to cultivate. But the A.-S *land-buend* only meant a head tiller of the soil: still, as such a one was also usually a father of a family, or *husband*, the word might soon very naturally take the double signification. Ihre unhesitatingly derives the Swedish word *bonde* (which in its simple form meant both a husband "maritus" and a *cultivator*), from the A.-S. *buend*. Upon the whole, then, Dr. Jamieson's etymology bids fairest to satisfy the inquirer.] 1. A man contracted or joined to a woman by marriage. A man to whom a woman is betrothed, as well as one actually united by marriage, is called a *husband*; Lev. xix.; Deut. xxii.—2. In *seamen's lan.*, the person who takes the direction and management of a ship's concerns upon himself, the owners paying him a commission for his trouble.—3. The male of the lower animals.—4. HUS'BANDMAN, *n.* 1. A farmer; a cultivator or tiller of the ground; one who labours in tillage. A husbandman is one who farms generally; that is, who both produces corn and cattle, and attends to the dairy, the poultry, the woodlands, and the orchard. A farmer may confine himself to grazing, or to breeding, or haymaking, or milking, or raising green crops for the market, &c.; but in none of these cases can he with propriety be called a husbandman. The term husbandman, therefore, is not exactly synonymous with farmer. In *N. Amer.* where men generally own the land on which they labour, the proprietor of a farm is also a labourer or husbandman; but the word includes the lessee and the owner.—2. The master of a family.

HUS'BANDRY, *n.* The business of a farmer, comprehending agriculture or tillage of the ground, the rais-

This genus has been long celebrated for the immense varieties which culture has produced from it. The *H. orientalis* is a native of the Levant, and grows in abundance about Aleppo and Bagdad. It obtained its name from the Grecian youth Hyacinthus, who was fabled to have been slain by Apollo, and changed into this flower. The root is a tunicated bulb, the leaves are broad and green, the corolla is funnel-shaped, and half cleft into six portions, the flowers point in all directions round the scape, which is erect. The hyacinth appears first to have been cultivated as a garden flower by the Dutch about the beginning of the 16th century. It was introduced into England about the end of that century. Hyacinth bulbs form a beautiful ornament when set in glasses. Two species of hyacinth are found in Britain, the wild hyacinth, the *H. non-scriptus,* Linn., which is the *Scilla nutans* of former botanists, and the grape hyacinth or starch hyacinth, *H. racemosus,* now called Muscari racemosum.—2. continued to weep, and were thence supposed to presage rain.

Hybrids have also been obtained, though less frequently, from different species of plants, insects, fishes, birds, and mammals. In the latter class, the most common and useful hybrid is that produced between the horse and the ass, denominated *par excellence* "the mule." Some rare instances have occurred of hybrids resulting from the connection of animals of different genera. It has a very strong affinity for water, acts energetically on glass, and is of all substances the most destructive to animal matter.

HY'DROGEN, *n*. [Gr. ὕδωρ, water, and γινομαι, to generate; so called as being considered the generator of water.] An important elementary substance, which is only known to us in the gaseous, or permanently elastic form. It was first correctly described by Cavendish, in 1766, under the name of *inflammable air*, and it was by some called *phlogiston*, from the notion that it is the matter of heat. The name *hydrogen* was given to it by the French chemists in consequence of its being one of the elements of water. It also forms a component of all vegetable and animal products, and is, therefore, abundantly diffused throughout nature. It is usually procured by the action of sulphuric acid and zinc or iron upon water, or by passing the vapour of water over red-hot iron. Pure hydrogen is a colourless, tasteless, and inodorous gas; it is a powerful refractor of light; the lightest body in nature, and hence the best material for filling balloons. One hundred cubic inches at mean temperature and pressure weigh only 2.13 grains; so that its specific gravity compared with air is 0.0694 to 1, and it is exactly 16 times lighter than oxygen. In consequence of its extreme lightness it is assumed as *unity* in speaking of the specific gravity of gases, as well as in referring to the proportions in which bodies combine. It is neither acid nor alkaline; it cannot support respiration, although it proves fatal to life from deprivation of oxygen, rather than from any inherent noxious quality. When in contact with air it is inflammable in an eminent degree, and burns with a pale blue flame; but it does not support combustion. Two volumes of hydrogen with six of air form an explosive mixture, and when two volumes of hydrogen are mixed with one of oxygen, and inflamed, the explosion is extremely violent. The flame of hydrogen is sometimes employed for exciting intense heat; but the most intense heat that can be produced is caused by the burning of hydrogen in oxygen gas, and this principle has been applied to increase the temperature of blast furnaces in iron-works, by making the gases pass separately through heated tubes to the furnace. Water is the sole product of the combustion of hydrogen gas; and when two volumes of pure hydrogen gas are mixed with one volume of pure oxygen gas, and the mixture inflamed in a proper manner by the electric spark, the gases totally disappear, and the interior of the vessel is covered with drops of pure water, equal in weight to the two gases. Again, if pure water be exposed to the action of voltaic electricity it is resolved into two volumes of hydrogen, and one of oxygen; so that water is proved both by synthesis and analysis to consist of two volumes of hydrogen combined with one of oxygen, or of one part by weight of hydrogen with eight of oxygen, so that the number 8 becomes the equivalent of oxygen, and 9 that of water. Hydrogen is sparingly soluble in water, nor is there any other liquid which is capable of dissolving it in great quantity. It unites with all other elementary gaseous bodies, and forms, with these, compounds, not only of great curiosity, but of vast importance and utility: thus with oxygen it forms water, with azote, ammonia, with chlorine, hydrochloric acid, with fluorine, hydrofluoric acid, &c. It forms compounds also with carbon, iodine, phosphorus, cyanogen, sulphur, &c.

The common description of hydrometers consists of a hollow ball of either metal or glass, capable of floating in any known liquid,

and having two stems, the lower one terminating in a weight, in order that the instrument may float with the stems upright, and the upper stem (which is of the same diameter throughout) being graduated, to show the density of the fluid by the depth to which it sinks; as the heavier fluids will buoy up the instrument more than such as are lighter. There are various other kinds of hydrometers. In Fahrenheit's the upper stem has a small dish on the top for holding weights, by means of which the instrument, when applied to different liquids, is always sunk to the same point in the stem, which is marked *Proof*, being the point to which the instrument sinks in proof-spirit. In Nicholson's hydrometer, there is a dish attached to the lower end of the lower stem, so that by means of the dish at the top, and the one at the bottom, the instrument is adapted for the purpose of ascertaining the specific gravity both of liquids and solids.

It is occasioned by inoculation with the saliva of a rabid animal, as by the bite of a mad dog. It is never produced in man by any other cause than the saliva of a rabid animal, and there is no evidence whatever to prove that the disease can be communicated from one human being to another. No medicine has been discovered of any efficacy in curing hydrophobia. The only means of saving the patient in the case of the bite of a mad dog, is to cut out the part bitten as soon as possible after the wound has been inflicted.

There are various constructions given to this instrument; a very accurate one is described in Dr. Lardner's Treatise on Hydrostatics and Pneumatics.—*Hydrostatic bellows*, an instrument contrived to show the upward pressure of fluids, and also that the pressure of a fluid upon the bottom of a vessel does not depend upon the quantity of the fluid but upon its altitude. It consists generally of two circular boards, connected with leather fastened closely round the edges, so as to leave a space between the boards. Into this cavity water is put, and an upright pipe is made to communicate with the interior. By placing weights upon the upper board the water rises in the tube above the level of the water in the bellows, and the small quantity of water in the tube is a balance for the water in the bellows and the weights.—*Hydrostatic paradox*, the name given to the hydrostatic principle above stated, viz., that the pressure of a fluid upon the bottom of a vessel does not depend upon the quantity of the fluid but upon its altitude. It is usually stated thus—"any quantity of fluid, however small, may be made to balance any quantity or any weight however great." It may be illustrated by the hydrostatic bellows.—*Hydrostatic press.* [*See* BRAMAH'S PRESS.]

An object uncommon in size, either great or small, strikes us with surprise, and this emotion produces a momentary conviction that the object is greater or less than it is in reality. The same effect attends figurative grandeur or littleness; and hence the use of the hyperbole, which expresses this momentary conviction. The following are instances of the use of this figure

In a right-angled triangle the square described on the hypothenuse is equal to the sum of the squares described on the other two sides. This important proposition is said to have been discovered by Pythagoras.

Hypothenuse, a b.

HY'POTHEC, *n.* [L. *hypotheca*, a pledge; Gr. ὑποθηκη, from ὑποτιθημι, to put under, to suppose.] In the *civil law*, an obligation by which the effects of a debtor are made over to his creditor in security of the debt, while, at the same time, they still remain in the possession of the debtor. The law of Scotland admits but of few hypothecs, viz., *hypothecs for rents*, and *maritime hypothecs*. As to the first, the landlord has a right of hypothec over the crop and stocking of his tenant; and as to the second, seamen have an hypothec in security of their wages over the freight due to the owners of the ship, and also over the ship itself; and the shipowner has an hypothec over the cargo for the freight of that cargo. There is also an hypothec to freighters, which gives security over the ship to the owners of the goods.

HYPOTH'ECATE, *v. t.* [L. *hypotheca*, a pledge; Gr. ὑποθηκη, from ὑποτιθημι, to put under, to suppose.] 1. To pledge, and properly to pledge the keel of a ship, that is, the ship itself, as security for the repayment of money borrowed to carry on a voyage. In this case the lender hazards the loss of his money by the loss of the ship; but if the ship return safe, he receives his principal, with the premium or interest agreed on, though it may exceed the legal rate of interest.—2. To pledge, as goods.

HYPOTH'ECATED, *pp.* Pledged as security for money borrowed.

HYPOTH'ECATING, *ppr.* Pledging as security.

A supposition; a proposition or principle which is supposed or taken for granted, in order to draw a conclusion or inference for proof of the point in question; something not proved, but assumed for the purpose of argument.—2. A system or theory imagined or assumed to account for what is not understood.—*Hypothesis*, in *geom.*, signifies the thing or things given in a theorem. Whatever is assumed or admitted as true, and from which the proof is to be derived, is termed the *hypothesis*.—*Hypothesis*, in *physics*, as distinguished from *theory*, may be defined, an explanation of nature or of natural phenomena from assumed facts. [*See* THEORY.] We have *hypotheses* to account for the tides, for gravity, for magnetism, for light, for the deluge, &c. Hypotheses in natural science have led to several important discoveries, and even those that are manifestly false have led to the discovery of many new facts by exciting a spirit of inquiry. The rivalry between the undulatory and emanatory hypotheses on the nature of light has much increased our knowledge of that agent.

HYPOTHET'IC, } *a.* Including
HYPOTHET'ICAL, } a supposition; conditional; assumed without proof for the purpose of reasoning and deducing proof.—*Hypothetical proposition* in *logic*, one which asserts not absolutely, but under an hypothesis, indicated by a conjunction.—*Hypothetical syllogism*, one of which the reasoning depends upon an hypothetical *proposition*.

I

I, is the ninth letter, and the third vowel of the English Alphabet. We receive it through the Latin and Greek from the Shemitic *jod*, *je*, or *ye*, in Greek ιωτα, whence our English word *jot*. This vowel in French and in most European languages, has the long fine sound which we express by *e* in *me*, or *ee* in *seen*, *meek*. This sound we retain in some foreign words which are naturalized in our language, as in *machine*, *intrigue*. But in most English words this long sound is shortened, as in *holiness*, *pity*, *gift*; in which words the sound of *i* coincides with that of *y* in *hypocrite*, and at the end of words, in unaccented syllables, as in *holy*, *glory*. It is this short sound of the French and Italian *i*, which we hear in the pronunciation of *been*, which we pronounce *bin*. After *l*, this letter has sometimes the liquid sound of *y*, as in *million*, pronounced *milyon*. This sound corresponds with that of the Hebrews, as in *Joseph*, which in Syria is pronounced *Yoseph*, and with the sound of the German *j*, as in *ja*, *jahr*, that is, *ya*, *yahr*. The form of I was originally identical with that of J, and it is only within the last century that any distinction was made between them. The sound of *i* long, as in *fine*, *kind*, *arise*, is diphthongal; it begins

with a sound approaching that of broad *a*, but it is not exactly the same, as the organs are not opened to the same extent, and therefore the sound begins a little above that of *aw*. The sound, if continued, closes with one that nearly approaches to that of *e* long. This sound can be learned only by the ear. This letter enters into several digraphs, as in *fail, field, seize, feign, vain, friend*; and with *o* in *oil, join, coin*, it helps to form a proper diphthong. No English word ends with *i*, but when the sound of the letter occurs at the end of a word, it is expressed by *y*; *alkali* is an exception. As a numeral I signifies *one*, and stands for as many units as it is repeated in times, as II, two, III, three, &c. When it stands *before* V or X, it subtracts itself, and the numerals denote one less than the V or the X. Thus IV expresses four, one less than V, five; IX stands for nine, one less than X, ten. But when it is placed *after* V or X, it denotes the addition of an unit, or as many units as the letter is repeated in times. Thus VI is five and one, or six, and XI is ten and one, or eleven; VIII stands for five and three, or eight, &c. Among the ancient Romans, IↃ stood for 500; CIↃ, for 1000; IↃↃ, for 5000; CCIↃↃ, for 10,000; IↃↃↃ, for 50,000; and CCCIↃↃↃ, for 100,000. As an abbreviation *i* is placed with *e*, (*i. e.*) to signify *id est*, or, that is. I, formerly prefixed to some English words, as in *ibuilt*, is a contraction of the Saxon prefix *ge*; and more generally this was written *y*.

I, *pron.* [Sax. *ic*; Goth. and D. *ik*; G *ich*; Sw. *jag*; Dan. *jeg*; Gr ἐγώ; L. *ego*; Port. *eu*; Sp. *yo*; It. *io*; Fr. *je*; Sans. *agam*. In Armoric *me* is the nominative; so W. *mi*, Fr. *moi*, Hindoo, *me*. Either *ego* is contracted from *mego*, or *I* and *me* are from different roots. It is certain that *me* is contracted from *meg* or *mig*. *See* ME.] The pronoun of the first person; the word which expresses one's self, or that by which a speaker or writer denotes himself. It is only the nominative case of the pronoun; in the other cases we use *me*. *I* am attached to study; study delights *me*. We often hear in popular language the phrase *it is me*, which is now considered to be ungrammatical, for *it is I*. But the phrase may have come down to us from the use of the Welsh *mi*, or from the French use of the phrase *c'est moi*. In the plural we use *we*, and *us*, which appear to be words radically distinct from *I*. Johnson observes that Shakspeare uses *I* for *ay* or *yes*. In this he is not followed, and the use is incorrect.

IAM'BICS, *n. plur.* A species of verse consisting of short and long syllables alternately, used by the Greek and Latin poets, and especially by the Greek tragic poets. According to Aristotle, the iambic measure was first employed in satirical poems, called *iambi*, which appear to have been represented or acted.

ICE, *n.* [Sax. *is*, *isa*; G. *eis*; Sw. and Ice. *is*; Ir. *cuise*. The true orthography would be *ise*. The primary sense is doubtless to set, to fix, to congeal, or harden. It may be allied to the G. *eisen*, iron; perhaps also to L. *os*, a bone.] 1. Water or other fluid congealed, or in a solid state; a solid, transparent, brittle substance, formed by the congelation of a fluid by means of the abstraction of the heat necessary to preserve its fluidity, or, to use common language, congealed by cold. Water begins to freeze at 32° of Fahrenheit, and in freezing expands very rapidly, and with great force. In consequence of this expansion the ice becomes lighter than water, and floats on its surface. Its specific gravity is nearly 0.92, so that the volume of ice is to that of water as 1 to 0.92, consequently water expands by about $\frac{1}{11}$th of its bulk in passing into ice. During the formation of ice the particles arrange themselves into ranks and lines which cross each other at angles of 60° and 120°, as may be seen by examining the surface of water while freezing in a saucer. Artificial ice may be formed by exposing water to the action of substances that produce quick evaporation, such as ether and sulphuric acid. The process will be greatly accelerated if made to take place under the exhausted receiver of an air-pump. On this principle ice is formed artificially in the hottest countries. [*See* FREEZING.]—2. Concreted sugar.—*To break the ice*, is to make the first opening to any attempt; to remove the first obstructions or difficulties; to open the way.

ICEBERG, *n.* [*ice* and G. *berg*, a hill.] A hill or mountain of ice, or a vast body of ice accumulated in valleys in high northern latitudes, or floating on the ocean. This term is applied to such elevated masses as exist in the valleys of the frigid zones; to those which are found on the surface of fixed ice; and to ice of great thickness and height in a floating state. These lofty floating masses are sometimes detached from the icebergs on shore, and sometimes formed at a distance from

Iceberg.

any land. They are found in both the frigid zones, and are sometimes carried toward the equator as low as 40°. Masses of this sort abound in Baffin's Bay, where they are sometimes two

miles long and one half or one third as broad: Scoresby counted 500 of these bergs drifting along in latitudes 69° and 70° north, which rose above the surface of the sea from the height of 100 to 200 feet, some of them a mile in circumference. It is computed that the depth of icebergs below the surface of the water is about eight times greater than the height above the water. Many icebergs contain, among other substances, granite, gneiss, mica-schist, clay-slate, granular feldspar, and green-stone.

Literally, that which is seen; hence, form, image, model of any thing in the mind; that which is held or comprehended by the understanding or intellectual faculties.—[Instead of attempting any further definition of this very abstract term—a task confessedly difficult—we shall equally avoid a charge of error and of dogmatizing, by simply reporting definitions already given by recognized authorities.]

> I have used the word *idea*, to express whatever is meant by phantasm, notion, species, or whatever it is which the mind can be employed about in thinking.... Whatever the mind perceives in itself, or is the immediate object of perception, thought, or understanding, that I call an *idea* *Locke.*

> In *popular language, idea* signifies the same thing as conception, apprehension, notion. To have an *idea* of any thing is to conceive it. In *philosophical use*, it does not signify that act of the mind which we call thought or conception, but some *object* of thought *Reid.*

> According to modern writers on mental philosophy, an *idea* is the object of thought, or the notice which the mind takes of its perceptions. Darwin, in his *Zoonomia*, uses *idea* for a notion of external things which our organs bring us acquainted with originally, and he defines it a contraction, motion, or configuration of the fibres which constitute the immediate organ of sense; synonymous with which he sometimes uses *sensual motion*, in contradistinction to *muscular motion.* *Ency Met.*

> I use the word *idea* [in the "Biographia Literaria"] in Mr. Hume's sense, viz. by distinguishing those representations which are accompanied with a sense of a present object, from those reproduced by the mind itself, designating the former by *impressions*, and confining the word *idea* to the latter—this I do on account of its general currency among English metaphysicians, though against my own judgment. The word *idea*, as used by Pindar, Aristophanes, and in the gospel of Matthew, represented "the visual abstraction of a distant object, when we see the whole without distinguishing its parts." Plato adopted it as a technical term. *ideas* he considered as "mysterious powers, living, seminal, formative, and exempt from time" Descartes adopted the fanciful hypothesis of *material ideas*, or certain configurations of the brain, which were as so many moulds to the influxes of the external world. *S. T. Coleridge.*

> This word (*idea*) is often applied to any kind of thought, or notion, or belief; but its more proper use is restricted to such thoughts as are images of visible objects, whether actually seen and remembered, or compounded by the faculty of imagination. The words notion, or opinion, would often be well substituted for the word *idea.* *Isaac Taylor.*

> By *ideas* Kant eminently designated every conception formed by the reason, (as distinct from the understanding,) and raised above all sensuous perception. These *ideas* he subdivides into, 1st, *empirical*, which have an element drawn from experience, for instance, organization, a state, a church; and, 2nd, *pure*, which are totally free from all that is sensible or empirical, such as liberty, immortality, holiness, felicity, Deity. Another division of the Kantian ideas, is into *theoretical* and *practical*, according to a similar division of the reason itself. Thus the idea of truth is a theoretical, that of morality a practical idea.

IDE'ALESS, *a.* [*idea* and *less.*] Destitute of ideas.

IDE'ALISM, *n.* The name usually given to that system of philosophy, according to which, what we call external objects are mere phenomena of our own minds. It originated with Descartes. Malebranche went a step further; but Bishop Berkeley was the first who sought to prove the non-existence of matter, and is therefore regarded as the founder of modern idealism. According to this philosopher, all which really exists is spirit, or the thinking principle,—ourselves, our fellow men, and God. Matter does not exist independently of our sensations, but conceptions of a material world are produced by the operation of the Deity upon our understanding, and the material world exists only in the Divine intellect, who awakens in us certain sensuous conceptions in a definite order, which order is what we call the course of nature.

IDE'ALIST, *n.* One who holds the doctrine of idealism.

IDEAL'ITY, *n.* In *phrenol*, one of the sentiments proper to man. Its organ is situated immediately above *acquisitiveness*, and extends forward over that organ from *cautiousness.* Its function is to produce the feeling of beauty and perfectibility,—to elevate and imbue every idea conceived by the mind, with a feeling of exquisiteness and enthusiasm. It gives rise to poetical rapture.

which the terms of the subject and the predicate are the same, or comprise the same idea. It is an identical proposition in physics, that the whole is equal to its parts. IDEN'TISM, *n.* A name applied to the metaphysical theory of Schelling. [*See under* IDENTITY.]

IDEN'TITY, *n.* [Fr. *identité.*] Sameness, as distinguished from similitude and diversity; the sameness of a substance under every possible variety of circumstances. Among philosophers, *personal identity* denotes the sameness of the conscious subject *I*, throughout all the various states of which it is the subject.—*System of identity*, in *phil.*, (otherwise called *identism*,) a name which has been given to the metaphysical theory of the German writer Schelling. It rests on the principle that the two elements of thought, the objects respectively of understanding and reason, called by the various terms of matter and spirit, objective and subjective, real and ideal, &c., are only relatively opposed to one another, as different forms of the one *absolute* or *infinite*: hence sometimes called the two poles of the absolute. In a secondary sense the term *identity* denotes a merely relative sameness, which may be also called logical, or abstract. Thus in *logic*, whatever things are subjects of the same attribute, or collection of attributes, are considered the same; for example, *dog* and *lion* are the same relatively to the common notion *quadruped*, under which they are both contained. Again, in *physics*, a tree may be assumed to be the same in relation to all the rights of property, notwithstanding the physical change which it undergoes from the constant segregation of old, and aggregation of new particles. Lastly, it is only in this logical use of the term, that we can be said in memory to be conscious of the identity of the reproduced, and the original idea, for if they were absolutely identical, it would be impossible to distinguish between the first appearance, and the recurrence of an idea. By the system of *absolute identity* is meant, the doctrine which teaches the oneness of the subject and object (spirit and matter), as merely different aspects of one substance; otherwise called *identism.*

IDEO'GRAPHIC, *a.* [Gr. ιδεα, an idea, and γραφω, writing.] An epithet applied to that way of writing which expresses the ideas, and not the sound. The science of ideas, or of mind; a term applied by the later disciples of the French philosopher Condillac, to the history and evolutions of human ideas, considered as so many successive modes of certain original, or transformed sensations. Proceeding from this exclusive and partial view, nothing perhaps can equal the logical simplicity of the writings of this school, the subtlety of its abstraction, the boldness of its generalisations, or its analytical dexterity in reducing an idea to its simplest expression.

The size attained by the Iguanodon appears to have been enormous, the average length from the snout to the tip of the tail, being estimated by Dr. Mantel at seventy feet; while he considers some may have been one hundred feet in length. A most remarkable appendage possessed by the Iguanodon was a horn of bone placed upon the nose, equal in size, and resembling in form the lesser horn of the rhinoceros. From the great resemblance in the teeth, as well as in many other extraordinary characteristics of this immense reptile, to that of the Iguana, Dr. Mantel gave i the name of Iguanodon, which signifies an animal having teeth like the Iguana.

> *Ill* bears the sex the youthful lover's fate,
> When just approaching to the nuptial state.
> *Dryden.*

ILL, prefixed to participles of the present tense, and denoting evil or wrong, may be considered as a noun governed by the participle, or as making a part of a compound word; as, an *ill meaning* man, an *ill designing* man, an *ill boding* hour; that is, a man meaning ill, an hour boding ill. It is more consonant, however, to the genius of our language, to treat these and similar words as compounds. In some cases, as before the participles of intransitive verbs, *ill* must be considered as a part of the compound, as in *ill-looking*. When used before the perfect participle, *ill* is to be considered as an adverb, or modifying word, or to be treated as a part of the compound; as in *ill-bred*, *ill-governed*, *ill fated*, *ill-favoured*, *ill-formed*, *ill-minded*. In these and all similar connections, it might be well to unite the two words in a compound by a hyphen. As *ill* may be prefixed to almost any participle, it is needless to attempt to collect a list of such words for insertion.

Il, prefixed to words beginning with *l*, stands for *in*, as used in the Latin language, and usually denotes a negation of the sense of the simple word, as *illegal*, not legal; or it denotes *to* or *on*, and merely augments or enforces the sense, as in *illuminate*.

We use the same prefix in compounds not of Latin origin, as in *imbank*, *imbitter*. For *im*, the French write *em*, which we also use in words borrowed from their language.—*Im* is sometimes augmentative, and in this case it may be exchanged for *em*, *en*, or *in*. Sometimes it is negative, in which case it may be exchanged for *in* or *un*, but not for *em*. It might be a means of avoiding uncertainty and confusion if the augmentatives were always written with *e*.

Images are generally formed by mirrors or lenses, and accurately resemble the object in shape and colour, although they may differ from it in size and position, being sometimes inverted. > *Imaginary* ills and fancied tortures. *Addison.*

Imaginary or *impossible quantities*, in *alge*, are certain expressions that arise in various algebraical and trigonometrical operations, to which no value, either rational or irrational, can be assigned, yet being substituted in the equation whence they were deduced, they are found to answer the conditions of the question. Such quantities naturally arise out of the generalization of algebraical symbols, such as by extracting the even roots of negative quantities, as $\sqrt{-a}$, $\sqrt{-a^4}$, which quantities can have no real root.—*Imaginary roots of an equation*, those roots or values of the unknown quantity which contain some imaginary quantity.—*Imaginary focus*, in *optics*, the point towards which converging rays tend, but which they are prevented from coming to by some obstacle. It is also termed the *virtual focus*.

IMAGINA'TION, *n.* [L. *imaginatio;* Fr. *imagination*.] 1. The power or faculty of the mind by which it conceives and forms ideas of things communicated to it by the organs of sense. "*Imagination*," says Bacon, "I understand to be the representation of an individual thought." According to Glanville, simple apprehension of corporeal objects, if present, is sense; if absent, is *imagination*, [conception.] *Imagination*, in *its proper sense*, according to Reid, signifies a lively conception of objects of sight. It is distinguished from conception as a part from a whole. "The business of conception," says Stewart, "is to present us with an exact transcript of what we have felt or perceived. But we have also a power of modifying our conceptions, by combining the parts of different ones so as to form new wholes of our own creation. I shall employ the word *imagination* to express this power. I apprehend this to be the proper sense of the word, if imagination be the power which gives birth to the productions of the poet and the painter." We would define *imagination* to be the will working on the materials of memory; not satisfied with following the order prescribed by nature, or suggested by accident, it selects the parts of different conceptions, or objects of memory, to form a whole more pleasing, more terrible, or more awful, than has ever been presented in the ordinary course of nature. The two latter definitions give the true sense of the word, as now understood. It is often employed in a narrow acceptation as synonymous with *fancy*, which properly is only a particular species of imagination combined with judgment. In its widest signification, however, imagination is co-extensive with *invention*, furnishing the writer with whatever is most happy, and appropriate in language, or vivid and forcible in thought In the same manner, it is the imagination that suggests to the scientific inquirer those bold conjectures of analogy or difference, which lay open the secrets of nature, and multiply its usefulness to man "All the objects of human knowledge," says Dugald Stewart, "supply materials for the forming hand of imagination; diversifying infinitely the works she produces, while the mode of her operation remains essentially the same." A disordered imagination exhibits itself chiefly under three forms or characters—the fantastical, the fanatic, and the enthusiastic; and similarly the due succession of its representations may be triply distinguished into the natural, the logical, and the poetical. On the particular character of the imagination depends the happiness or misery of the individual.

The power of the mind to decompose its conceptions, and to recombine the elements of them at its pleasure, is called its faculty of *imagination*. *Isaac Taylor.*

Its organ is situated at the upper and fore part of the head, on each side of *benevolence*. When any person is impeached, articles, containing the accusation, are exhibited on behalf of the commons, who appoint managers to conduct the prosecution. These articles are carried to the lords, and if they find the accused guilty upon sufficient evidence, no pardon under the Great Seal can be pleaded to such impeachment. A peer may be impeached for any crime for which he is liable, by his peers only; but a member of the house of commons cannot be impeached before the lords (who, in fact, are the judicature) but for high misdemeanours. Till the house of commons demand judgment on an impeachment exhibited by them, the lords cannot pass sentence. In *the United States,* it is the right of the house of representatives to impeach, and of the senate to try and determine impeachments. The senate of the United States, and the senates in the several states, are the high courts of impeachment.—3. The act of impeaching.—4. It is one of the general properties of matter, and one essential to the existence of bodies, and implies, that two bodies cannot exist in the same place at the same time, or that every body possesses the property of excluding every other body from the place which itself occupies. This is a truth, not only established by experiment, but also by the common sense of mankind. There are cases in which two bodies when united, as for instance, two liquids, occupy a space less than that occupied by their aggregate bulk before the union, but this arises from the particles of the one entering the pores of the other. When a sponge is immersed in water, the water enters into the pores of the sponge and not into its substance. [*See* POROSITY, PROPERTY.]—3. Insusceptibility of intellectual impression.

IMPOS'SIBLE, *a.* [Fr. from L. *impossibilis; in* and *possibilis,* from *possum,* to be able] 1. That cannot be. It is *impossible* that two and two should make five, or that a circle and a square should be the same thing, or that a thing should be and should not be at the same time. In *logic,* a proposition is said to be *impossible* when it contains two ideas which mutually destroy each other, and which can neither be conceived, nor united together. Thus it is impossible that a circle should be a square; because we conceive clearly, that squareness and roundness destroy each other, by the contrariety of their figure.—2. Impracticable; not feasible; that cannot be done.

With men this is *impossible;* but with God all things are possible, Matt. xix.

Without faith it is *impossible* to please God; Heb. xi.

There are two kinds of impossibilities; *physical* and *moral.* That is a *physical impossibility,* which is contrary to the law of nature. A thing is said to be *morally impossible,* when in itself it is possible, but attended with difficulties or circumstances which give it the appearance of being impossible. Some logicians distinguish a third kind of impossibility, viz. a *mathematical impossibility,* which involves an absurdity and self-contradiction. For example, that two straight lines should enclose a space, is not only impossible, but inconceivable, as it would be at variance with the definition of a straight line. [*See* POSSIBLE, PRACTICABLE, and IMPRACTICABLE.]—3. In *algebra, impossible* commonly signifies the same thing as *imaginary.* [*See* IMAGINARY.] *Impossible forms of equations,* in the *indeterminate analysis,* are those that will admit of no solution in rational numbers, neither integral nor fractional.

IN, a prefix, L. *in*, is used in composition as a particle of negation or privation; also written *un*, and in A. Sax. *on*. In this sense it is never written *en*. It sometimes adds its own signification *in*, *into*, *within*, to the word to which it is prefixed, and is also written *en*. Thus used it may be considered as opposed to *e* or *ex*; as, to *in*-clude, to *ex*-clude; *in*-close, *in*-clusive, *ex*-clusive; *in*-hale, *ex*-hale; *in* gress, *e*-gress. We have *in* also very commonly written *en* or *em*, augmenting the force of the word to which it is prefixed. Thus used it may be considered as opposed to *de*, *di*, or *ais*, and also to *un*; as, to *en*-able, to *dis*-able; to *en*-courage, to *dis*-courage; to *in*-crease, to *de*-crease. *In*, before *l*, is changed into *il*, as in *illusion*; and before *r*, into *ir*, as in *irregular*; and into *im*, before a labial, as in *imbitter*, *immaterial*, *impatient*. In a few instances it is changed into *ig*; as, *ignoble*, *ignominy*.

IN, *prep.* [L. *in*; Gr. εν; Goth. *in*; Sax. *in*; Fr. *en*; G. *in* or *ein*; Dan. *ind*; W. *yn*; Sans. *antu*.] *In* denotes present or inclosed, surrounded by limits; as, *in* a house; *in* a fort; *in* a city. It denotes a state of being mixed; as, sugar *in* tea; or combined, as carbonic acid *in* coal, or latent heat *in* air. It denotes present in any state; as, *in* sickness or health. It denotes present in time; as, *in* that hour or day. The uses of *in*, however, cannot, in all cases, be defined by equivalent words, except by explaining the phrase in which it is used; as, *in* deed; *in* fact; *in* essence; *in* quality; *in* reason; *in* courage; *in* spirits, &c. A man *in* spirits or good courage, denotes one who possesses at the time spirits or courage; *in* reason, is equivalent to *with* reason; one *in* ten, denotes one of that number, and we say also *one of* ten, and one *out of* ten.—*In the name*, is used in phrases of invoking, swearing, declaring, praying, &c. In prayer, it denotes by virtue of, or for the sake of.—*In the name of the people*, denotes on their behalf or part; in their stead, or for their sake. *In*, in many cases, is equivalent to *on*. This use of the word is frequent in the scriptures; as, let fowls multiply *in* the earth. *In* signifies by or through. *In* thee shall all nations be blessed. I am glorified *in* them.—*In a hill*, properly denotes *under* the surface; but *in a valley*, denotes *on* the surface of the land.—*In that*, is sometimes equivalent to *because*.

Some things they do *in that* they are men, some things *in that* they are men misled and blinded with error. *Hooker.*

In these and similar phrases, *that* is an antecedent, substitute, or pronoun relating to the subsequent part of the sentence, or the subsequent clause. God commendeth his love toward us, *in that* while we were yet sinners, Christ died for us. That is, in the facts stated in the latter clause, for which *that* is the substitute; Rom. v. —*In as much*, seeing; seeing that; this being the fact. I will ride for health, *inasmuch* as I am infirm. *In* is often used without the noun to which it properly belongs. I care not who is *in*, or who is *out*, that is, *in office*, or *out of office*. Come *in*, that is, into the house or other place. Who has or will come *in*, that is, into office. A vessel has come *in*, that is, into port, or has arrived.—*To be* or *keep in with*, to be close or near. *Keep* the ship *in with* the land. In *marine language*, a ship's sails are said to be *in*, when they are furled or stowed; and when they are set or extended, they are said to be *out*. *In* is also used as an order to shorten sail, where the word *take* is understood; as, *in* top-gallant sails!

The manner of falling on, or the direction in which one body falls on or strikes another.—*Angle of incidence*, in *dynamics* and *optics*, generally denotes the angle formed by the line of incidence, and a line drawn from the point of contact, perpendicular to the plane or surface on which the body or ray impinges. Thus, if a body A impinges on the plane DE, at the point B, and a perpendicular BH, be drawn, then the angle ABH is generally called the angle of incidence, and ABD the angle of inclination. Some authors, however, make ABD the angle of incidence, and ABH, the angle of inclination. In *optics*, the line of direction in which a ray is propagated, as AB, is called the *line of incidence* or the *incident ray*, and the point B where an incident ray meets the reflecting or refracting surface is called the *point of incidence*. Also, BH is called the *axis* of incidence. It is a fundamental principle in optics, that the angle of incidence ABH is equal to the angle of reflection HBC, where AB is the incident ray, and BC the reflected ray. [*See* REFLECTION.] When an elastic body strikes a hard and fixed plane, it rebounds from the plane making the angles of incidence and reflection equal. *Angles of incidence and refraction.*—[*See* REFRACTION.]

INCLINED, *pp* Having a leaning or tendency; disposed.—*Inclined plane*, in *mech.*, a plane inclined to the horizon, or forming with a horizontal plane any angle whatever excepting a right angle. It is one of the mechanic powers or simple machines, and is defined to be a hard plane surface forming some angle with a horizontal plane, that angle not being a right angle - *The angle of inclination* or *elevation* is the angle formed by two straight lines drawn in the sloping and horizontal planes perpendicular to their common intersection The figure ABD represents an inclined plane; AD is the plane properly so called; DB the height of the plane, BA its base, and BAD the angle of inclination or elevation. The power necessary to sustain any weight on an inclined plane, is to the weight as the height of the plane to its length; or as DB to DA. Hence, the less the height of the plane in proportion to its length, or the less the angle of inclination, the greater the mechanical effect. The inclined plane is a very simple and useful machine, and enables us to raise a given weight, along an inclined surface to a given elevation, with less expense of force, than would be required to raise it perpendicularly to the same elevation. Thus, a man by means of an inclined plane, which he can easily construct with a board or a couple of bars, can raise a load into a cart or waggon which ten men could not lift with their hands. Sloping roads, stairs, gangways, &c., may be considered as inclined planes. The inclination or slope of a road is estimated by the number of feet which it rises in a certain length; thus, we say a road has a rise of one foot in twenty.

Acts of indemnity are sometimes passed to relieve ministers from the responsibility of measures, exceeding their strict constitutional powers, taken by them when parliament was sitting to meet some unforeseen public emergency, or in ignorance, it may be, that they had exceeded the powers vested in them by the constitution. The term *indenture* implies that the deed is of two parts, and that they were cut by the waving line in order to afford additional means of authentication. One of the parties kept the one part, and the other party the other or counterpart, and when the two parts were afterwards compared together, and the indented edges found to fit each other exactly, a proof was thereby furnished that no fraud had been practised by either party. Anciently it was usual to write both parts on the same piece of parchment with some words or letters written between them, through which the parchment was cut either in a straight or indented line. In deeds effecting modern transactions, however, where two or more persons are equally interested in a deed, it is deposited with some person for their joint use. Hence, the term *indenture*, in common acceptation, now implies little more than that the deed is made by and between two or more parties [*See* DEED POLL.] In *Scotland*, the term *indenture* is generally applied to the mutual contract between master and apprentice, by which the master becomes bound to teach the apprentice his trade or profession, and the apprentice to give his time and services, and to pay an apprentice fee.

IN'DIAN ARCHITECT'URE The architecture of India, in its details,

Indian Capital (Elephanta.)

bears a striking resemblance to that of Persia and Egypt, and they are considered to have a common origin. Its monuments may be divided into two classes the *excavated*, which is either in the form of a cavern, or in which a solid rock is sculptured into the resemblance of a building; and the *constructed*, in which it is actually a building, or formed by the aggregation of different materials. The first class is exemplified in the caves of Elephanta and Ellora, and the sculptured pagodas of Mavalipouram, and the second class in the pagodas of Chillimbaram, Tanjore, and others. The architecture of India, it is said, resembles in its details that of Egypt, but its differences are also very striking. In the architecture of Egypt massiveness and solidity are carried to the extreme; in Indian architecture these have no place. In the former the ornaments are subordinate to the leading forms, and enrich without hiding them. In the latter, the principal forms are overwhelmed and decomposed by the accessories. In the one grandeur of effect is the result, while littleness is the characteristic of the other.

IN'DIGO, *n.* [L. *indicum*, from *India*; Fr. It. and Sp. *indigo.*] A well-known and beautiful blue vegetable dye, which is extensively employed in dyeing and calico printing. It is obtained by the maceration in water of several tropical plants; but the indigo of commerce is almost entirely obtained from leguminous plants of the genus Indigofera, that cultivated in India being the *I tinctoria*, and that in America the *I anil*. The plant is bruised and fermented in vats of water, during which it deposits indigo in the form of a blue powder, which is collected and dried so as to form the cubic cakes, in which it usually occurs in commerce. In this state it has an intensely blue colour and earthy fracture; that is most esteemed which, when rubbed by a hard body, assumes a fine copper-red polish. Indigo is quite insoluble in water, but when exposed to the action of certain deoxidizing agents, it becomes soluble in alkaline solutions, losing its blue colour, and forming a green solution, from which it is precipitated by the acids white, but it instantly becomes blue by exposure to air. The great mart for indigo is Bengal, and the other provinces subject to the presidency of that name, from the 20th to the 30th degree of north latitude. According to Berzelius, the indigo of commerce, besides some earthy matter, consists of indigo-blue, indigo-red, indigo brown, and a glutinous matter —*Indigo blue*, or, as it has been called, *indigotine*, is indigo nearly in a state of purity It is prepared by treating common indigo with dilute acids, alkalis, and alcohol. It is soluble in strong sulphuric acid, the solution has an intense blue colour, and is employed occasionally in dyeing, under the name of Saxon or liquid blue Indigotic acid is prepared by treating indigotine with twice its weight of hot nitric acid

A material illation of a universal from a singular, as warranted either by the general analogy of nature, or the special presumptions afforded by the object matter of any real science. 3. A formal illation of a universal from the individual as legitimated solely by the laws of thought, and abstracted from the conditions of any particular matter. The second of these operations is the inductive method of Bacon, which proceeds from particulars to generals, and from generals to still higher generalities, by means of rejections and conclusions, so as to arrive at those axioms and general laws, from which we may infer, by way of synthesis, other particulars unknown to us, and perhaps placed beyond the reach of direct examination. Aristotle's definition coincides with No. 3 as above; induction, according to him, being an inference drawn from all the particulars.—"*Induction*, (says Isaac Taylor) is the drawing, or leading off an inference, or general fact, from a number of instances, or, it is the summing up of the result of observations and experiments. It was Lord Bacon who introduced this term into philosophy; and who moreover taught the true method of acquiring a knowledge of the laws of nature, by attending to facts, and by carefully comparing a great number of instances; instead of the old method of philosophizing, which consisted in forming a theory, or supposition, independently of all facts, and then explaining the appearances of nature on the blind assumption that the theory was true The old method was the shortest and the easiest; but it was utterly fallacious. The modern, or Baconian method, is laborious and difficult; but it is successful, and has proved in the highest degree beneficial" The *inductive* process is exactly the reverse of the *deductive*, for while the latter proceeds from the whole to the part, the former ascends from the part to the whole; since it is only under the character of a constituted or containing whole, or as a constituent or contained part, that any thing can become the term of logical argumentation. In *rhet*, the confirming of a general proposition, by the statement of single facts, is often called an argument from enumeration; if each fact in the detailed statement requires only to be brought forward to be admitted, and if the general proposition is previously admitted as the aggregate of the single facts, the argument is strictly deductive, and the proof metaphysical, or demonstrative; if the facts are admitted on the ground of probability alone and the general proposition not as a metaphysical, but only as a moral universal, the argument is strictly inductive, and the proof can amount at its strongest only to what is called moral certainty; if the facts are admitted on experimental evidence, and the general proposition suggests itself as a truth in which they all meet, which can, however, no longer appear a truth than as it depends on such evidence, then is the proof also strictly inductive, and the evidence in this case is called physical or experimental.—*Induction*, in *math.*, is a term used to denote those cases in which the generality of any law or form is inferred from observing it to have obtained in several cases. An instance of mathematical induction occurs in every equation of differences, in every recurring series, &c.—*Induction*, in *nat. phil.*, consists in drawing general conclusions from particular facts or phenomena, and from general conclusions others more general, until we arrive at the most general of all. The most general conclusions at which we can arrive by legitimate induction are considered as principles or laws of nature. Thus from a number of facts and experiments regarding the falling of bodies towards the earth's centre we arrive at the general conclusion, that all bodies gravitate towards the earth's centre with forces proportioned to their masses, and inversely as the squares of their distance from the centre. In other words, we establish the doctrine of terrestrial gravitation. By examining the motions of the heavenly bodies and availing ourselves of the laws of terrestrial gravitation previously established, we are enabled to carry the inductive process still higher, and to arrive at a still more general conclusion, namely, that every particle of matter attracts every other particle in the universe with a force proportional to the product of their masses directly, and the square of their mutual distance inversely, and is itself attracted with an equal force. In this manner Newton established the theory of universal gravitation. When general principles have once been established by induction, they can be employed as first truths or axioms and applied to particular instances. This method reverses the order of the inductive process, as it proceeds from generals to particulars: thus, having once established the general principle that all terrestrial bodies tend to the earth's centre by gravity, the tendency of any particular body to the centre is immediately inferred from the general principle. This latter mode of reasoning from generals to particulars is termed *deductive* reasoning, and must be carefully distinguished from the *inductive* process "One of the most beautiful specimens of inductive experimental inquiry lying within a moderate compass," says Sir John Herschel in his Discourse on the Study of Natural Philosophy, "is the Theory of Dew, first developed by Dr. Wells."—*Induction*, in *electricity*, that effect of an insulated electrified body which tends to produce an opposite electrical state in surrounding bodies. *Magnetic induction* is analogous to electrical induction.—*Electro-magnetic induction*, the production of magnetism by electricity in motion. It is found that iron and other ferruginous bodies acquire magnetic properties when placed in the vicinity of electric currents.—*Volta-electric induction*, the production of electricity by a proximate electric current.—*Magneto-electric induction*, the production of electricity by magnetism

in motion.—4. The conclusion or inference drawn from premises or from propositions which are admitted to be true, either in fact, or for the sake of argument.—5. The introduction of a clergyman into a benefice, or giving possession of an ecclesiastical living. In *Great Britain*, *induction* is used for giving possession of ecclesiastical offices. In the *United States*, it is applied to the formal introduction of civil officers, and the higher officers of colleges.

But the distinction is not always observed, nor can it be; for we cannot always know whether means are *inefficacious*, till experiment has proved them *ineffectual*; nor even then, for we cannot be certain that the failure of means to produce an effect is to be attributed to habitual want of power, or to accidental and temporary causes. *Inefficacious* is therefore sometimes synonymous with *ineffectual.*

INER'TIA, *n.* [L.] Passiveness; inactivity. Inertia is a property of all bodies, and is of the utmost importance in mechanical investigations. It implies absolute passiveness, a perfect indifference to rest or motion. That matter is incapable of spontaneous change is one of the earliest and most universal results of human observation. It is equivalent to stating that mere matter is destitute of life, for spontaneous action is the only test of the presence of the living principle, and forms a great distinction between living bodies and dead matter. A body endued with inertia cannot of itself, and independent of all external influence, commence to move from a state of rest; neither can it when moving arrest its progress and become quiescent: it is likewise equally incapable of increasing or diminishing any motion which it may have received from an external cause. The effects and phenomena which hourly fall under our observation, afford unnumbered examples of the inability of lifeless matter to put itself in motion, or to increase any motion which may have been communicated to it. But we have not the same direct and frequent evidence of its inability to destroy or diminish any motion which it may have received. All the bodies that we see in motion are observed to move more and more slowly, losing their velocity by different degrees till the whole is exhausted, and the body comes to a state of rest; but this retardation or destruction of motion is entirely owing to external causes, as friction, the resistance of the air and gravity, and in proportion as we remove these impediments the motion continues longer. Hence we conclude that if these were entirely removed, a body once in motion would move for ever with a uniform motion. The law that a body is thus indifferent to rest and motion, is called the *law of inertia*. *Vis inertiæ*—*See* the term in its proper place.

Some place this infallibility in the pope, or bishop of Rome; some in a general council; others in neither pope nor council separately, but in both united. The opinion, however, most generally held among catholics is, that this infallibility is seated in a pope and general council. The infallibility of the Church of Rome forms one of the great controversies between protestants and Roman catholics, the former rejecting it entirely.

In common usage, a child ceases to be called an infant within the first or second year, but at no definite period. In some cases, authors indulge a greater latitude, and extend the term to include children of several years of age.—2. In *English law*, a person under the age of twenty-one years, whose acts the law, in many cases, pronounces *void*, or *null*, or *voidable*, that is, good until dissent had, and which may be ratified, after the infant's attaining full age, or set aside at the infant's option. In *Scots law*, the term infant is not used in this sense. It distinguishes three periods of life: pupillarity, which reaches from the birth of the child to the age of fourteen in males, and twelve in females; and during this period they are termed pupils:—puberty, which reaches from the termination of pupillarity to twenty-one years, which is the period of majority in both sexes; and from that time forward the person is said to be of lawful age.

INFECT', *v t* [Fr *infecter*, L. *inficio*, *infectus*; *in* and *facio*. In this application of *inficio*, as in *inficior*, to deny, we find the radical sense of *facio*, to make, which is to thrust, to drive. To *infect*, is to *thrust in*; to *deny*, is to *thrust against*, that is, to thrust away, to repel. And here we observe the different effects of the prefix *in*, upon the verb.] 1. To taint with disease; to infuse into a healthy body the virus, miasma, or morbid matter of a diseased body, or any pestilential or noxious air or substance by which a disease is produced. Persons in health are *infected* by the contagion of the plague, of syphilis, of small pox, of measles, of malignant fevers. In some cases, persons can be *infected* only by contact, as in syphilis; in most cases, they may be *infected* without contact with the diseased body.—2. To taint or affect with morbid or noxious matter; as, to *infect* a lancet; to *infect* clothing; to *infect* an apartment.—3. The thing which infects. In *med*, the terms *infection* and *contagion* are used as synonymous in a great majority of cases Different writers proposed and attempted to make a distinction between them, but there has been a great disagreement as to what the distinction should be; and in general no regard is paid to the proposed distinctions *Infection* is used in two acceptations; first, as denoting the effluvium or infectious matter exhaled from the person of one diseased, in which sense it is synonymous with *contagion*; and secondly, as signifying the act of communication of such morbid effluvium, by which disease is transferred. The atmosphere and other inert substances are often contaminated by the deleterious or offensive qualities of malaria, the matter of contagion, effluvia from putrid animal or vegetable substances, &c Some of these are at once recognized by the smell, others by chemical analysis, but the presence of others is known only by the diseases which they produce. The same means, however, may be applied in many cases for preventing the injurious effects of both classes. The most important and valuable method of disinfection is proper ventilation. The reputation of chlorine, acids, lime, charcoal, &c. for preventing or destroying infection, depends on their property of decomposing the offensive gases, which are so often mixed in the atmosphere with the matter of infection. Of these means the best is chlorine. When articles of clothing or of merchandise which are infected with contagious matter are exposed for some time to a temperature of about 220°, they become disinfected, especially if, at the same time, subjected to a current of air. Washing in soap and water, boiling, or steaming, are equally effective. [*See* CONTAGION.]—3. That which taints, poisons, or corrupts by communication from one to another; as, the *infection* of error or of evil example.—4. Contamination by illegality, as in cases of contraband goods. —5. But this distinction in the colloquial language of the law of Scotland is not always attended to. Anciently infeftment seems to have been synonymous with investiture; in which last sense it signified both the charter by which the superior conveyed the right, and the sasine or infeftment by which possession was given.—*Infeftment in security*, a term used to express an heritable bond and sasine, or a disposition in security and relative sasine, by which the creditor is infeft in an annual-rent out of the lands, corresponding to the principal sum, and in the lands themselves in security of the principal sum, interest, and penalty, or in the lands themselves redeemably, in security of the principal sum and interest.—*Infeftment of relief*. The bodies of the infusoria are for the most part gelatinous. When we place a drop of any decayed infusion of animal or vegetable matter under a powerful microscope, we discover in that drop various forms of living beings; some of a rounded and some of a lengthened form, and some exhibiting ramifications shooting in all directions; but all apparently of a soft, transparent, gelatinous, and almost homogeneous texture These beings constitute the lowest form of animals with which we are at present acquainted Animalcules are found so exceedingly minute, that nearly five hundred millions are contained in a single drop of water. They have an internal structure resembling that of the higher animals, exhibiting muscles, intestines, teeth, different kinds of glands, eyes, nerves, male and female organs of reproduction. Their powers of reproduction are so great, that from one individual a million were produced in ten days; on the eleventh day, four millions, on the twelfth, sixteen millions. Ehrenberg has described and figured more than five hundred species of animalcules; he has found them in fog, in rain, and in snow.

INSOLV'ENCY, *n.* [infra.] Inability

of a person to pay all his debts; or the state of wanting property sufficient for such payment. *Insolvency* is a term, in *mercantile law*, applied to designate the condition of all persons unable to pay their debts according to the ordinary usage of trade. A bankrupt is an insolvent, but persons may be in a state of insolvency, without having committed any of the specific acts which render them liable to a commission of bankruptcy. [*See* BANKRUPT.] The *law of Scotland*, in the ordinary case, takes bankruptcy as the legal indication of insolvency, the distinction between the two being, that a man may be actually insolvent though not bankrupt, since he may have so managed his affairs, as to have escaped the execution of those steps of real or personal diligence which are requisite to render him *notour*, or legally bankrupt. On the other hand a man may be rendered legally bankrupt, and yet be perfectly solvent.—2. Insufficiency to discharge all debts of the owner; as, the *insolvency* of an estate.—*Act of insolvency*. [*See infra*, INSOLVENT LAW.]

Not sufficient to pay all the debts of the owner; as, an *insolvent* estate.—3. Respecting insolvent debtors; relieving an insolvent debtor from imprisonment for debt, or from liability to arrest and imprisonment for debts previously contracted; as, an *insolvent* law. -*Insolvent law*, or *act of insolvency*, a law which liberates a debtor from imprisonment, or exempts him from liability to arrest and imprisonment on account of any debt previously contracted. These terms may be considered as *generic*, comprehending also bankrupt laws, which protect a man's future acquisitions from his creditors. But in a limited sense, as the words are now generally used, an insolvent law extends only to protect the person of the debtor from imprisonment on account of debts previously contracted. In this country statutes have from time to time been passed for the purpose of releasing from prison, and sometimes from their debts, persons whose transactions have not been of such a nature, as to subject them to the bankrupt laws. Under the bankrupt laws the creditors have a compulsory authority to sequestrate the entire possessions of their debtor; under the insolvent laws, the debtor himself may make a voluntary surrender of his property for the benefit of all his creditors. The proceedings under a commission of bankruptcy being instituted by the creditors, they lose all future power over the property and person of the insolvent, after he has obtained his certificate; but the proceedings under the insolvent act having been commenced by the debtor himself, he only, by the surrender of his effects, protects his *person* in future from arrest, while the property he may subsequently acquire is liable to be taken in execution for the payment of all his debts in full. By stat. 5 and 6 Vict. c. 116. in force from Nov. 1, 1842, any *insolvent* person, not being a trader, or, being a trader, owing debts in the whole of less than £300, on giving notice to his creditors, and publishing the same in the London Gazette and some local newspaper, of his intention to present a petition to the Court of Bankruptcy in London, or to a commissioner of bankrupts in the country, with a full statement of his affairs; thereupon a protection from arrest and all molestation will be granted him, until he make appearance in court, his estate and effects forthwith becoming vested in an official assignee, for the benefit of creditors. The law in Scotland, regarding insolvent debtors, differs in some respects, but especially in the forms of process, from the law of England. The act of breathing into any thing.—3. The infusion of ideas into the mind by the Holy Spirit; the conveying into the minds of men, ideas, notices, or monitions by extraordinary or supernatural influence.—*Inspiration of the sacred writers*, is defined an influence of the Holy Spirit exercised on the understandings, imaginations, memories, and other mental powers of the writers, by means of which they were qualified for communicating to the world divine revelation, or the knowledge of the will of God, without error or mistake. Writers on theology have enumerated several kinds or degrees of inspiration, which are founded upon the supposition that God imparted to the sacred writers that measure and degree of assistance which was just suited to the nature of the subjects which they committed to writing, and did not supersede the use of their natural powers and faculties, and of their acquired knowledge where these were sufficient. The measure of divine assistance which enabled Moses to give an account of the creation; Joshua to record with exactness the settlement of the Israelites in Canaan; David to mingle prophetic information with the varied effusions of gratitude, contrition, and piety; Isaiah to deliver predictions respecting the Messiah; and the Evangelists to record, in their own several styles and ways, the life and transactions of Jesus Christ, has been termed *inspiration of direction*. In some cases inspiration only produced correctness and accuracy in relating past occurrences, and preserved the writers generally from relating any thing derogatory to the revelation with which it was connected. This has been termed *inspiration of superintendency*. Where indeed it not only communicates ideas, new and unknown before, but has also imparted greater strength and vigour to the efforts of the mind than the writers could otherwise have attained, this divine assistance has been called *inspiration of elevation*. Further, when the prophets and apostles received such communications of the Holy Spirit, as suggested and dictated minutely every part of the truths delivered; this, which is the highest degree of divine assistance, has been termed *inspiration of suggestion*.

All Scripture is given by *inspiration* of God; 2 Tim. iii.

The sense of the root is to thrust; hence the compound, *instinctus*, signifies properly, thrust in, infixed. *See* INSTIGATE.] A certain power or disposition of mind by which, independent of all instruction or experience, without deliberation and without having any end in view, animals are unerringly directed to do spontaneously whatever is necessary for the preservation of the individual, or the continuation of the kind. Such, in the human species, is the *instinct* of sucking exerted immediately after birth, and that of insects in depositing their eggs in situations most favourable for hatching. Instinct makes animals provide for themselves and young, and utter those voices, betake themselves to that course of life, and use those means of self defence, which are suitable to their circumstances and nature. The nest of the bird, the honey-comb of the bee, the web of the spider, the threads of the silk-worm, the holes or houses of the beaver, are all executed by instinct, and are not more perfect now than they were four thousand years ago. *Instinct* may be defined, the operation of the principle of organized life by the exercise of certain natural powers directed to the present or future good of the individual. *Instinct* is the general property of the living principle, or the law of organized life in a state of action.

> And *reason* raise o'er *instinct* as you can,
> In *this* 'tis God directs, in *that* 'tis man. *Pope.*

Instinct being partly intended to make up for the want of understanding in animals, is more or less necessary to their preservation and comfort according as the understanding is more or less defective. In the beginning of life we do much by instinct, and little by understanding; and even when arrived at maturity, there are innumerable occasions on which, because reason cannot guide us, we must be guided by instinct. The complex machinery of nerves and muscles, necessary to swallowing our food, walking, &c., is set agoing by instinct. The motion of our eyelids, and those sudden motions which we make to avoid sudden danger, are also instinctive. *Instinct* differs from intellect by the unerring certainty of the means it employs, the uniformity of its results and the perfection of its works, prior to and independent of all instruction or experience; and, lastly, by the pursuit of nothing beyond what conduces directly either to the continuation of the individual, or the propagation of the kind.

In *electrical experiments*, placed on an electric or non-conducting substance, or surrounded by non-conductors; not communicating with the earth, or with other bodies. INSŪRANCE, or **ASSŪRANCE**, *n.* [from *insure.*] The act of insuring or assuring against loss or damage; or a contract by which a person, who thence is termed the *insurer*, in consideration of a sum of money, or percentage (technically called a *premium*) becomes bound to indemnify the *insured*, against certain risks to which his property is exposed. This contract is termed a *policy*, and as it is only signed by the insurer or insurers, who subscribe their names, and the amount for which they become liable, they are usually distinguished as *underwriters*. The best known, and most important kinds of insurances are *marine insurance*, *insurance on lives*, and *insurance against fire*. *Marine insurance* is the term used for the insurance on ships, goods, &c.; and the freight and hire of ships. *Fire insurance* is for the assuring of property from fire. *Life insurance* is for securing the payment of a certain sum, to friends or trustees, at the death of the individual insured, or for securing the payment of a sum at a given age, or of an annuity.—*Insurance broker*, one whose business is to procure the insurance of vessels, at sea, or bound on a voyage.—2. The premium paid for insuring property or life.—*Insurance company*, a company or corporation whose business is to insure against loss or damage.

INSURG′ENT, *n.* A person who rises in opposition to civil or political authority; one who openly and actively resists the execution of laws. [*See* INSURRECTION.] An *insurgent* differs from a *rebel*. The *insurgent* opposes the execution of a particular law or laws; the *rebel* attempts to overthrow or change the government, or he revolts and attempts to place his country under another jurisdiction. All *rebels* are *insurgents*, but all *insurgents* are not *rebels*.

INSURREC′TION, *n.* [L. *insurgo*; *in* and *surgo*, to rise.] 1. A rising against civil or political authority; the open and active opposition of a number of persons to the execution of law in a city or country. It is equivalent to *sedition*, except that *sedition* expresses a less extensive rising of citizens. It differs from *rebellion*, for the latter expresses a revolt, or an attempt to overthrow the government, to establish a different one or to place the country under another jurisdiction. It differs from *mutiny*, as it respects the civil or political government; whereas a *mutiny* is an open opposition to law in the army or navy. *Insurrection* is however used with such latitude as to comprehend either sedition or rebellion.

It is found that this city of old time hath made *insurrection* against kings, and that rebellion and sedition have been made therein; Ezra iv.

2. A rising in mass to oppose an enemy. [*Lit. us.*]

IN′TEGER, *n.* [L. *See* ENTIRE.] The whole of any thing; particularly, in arithmetic, a whole number, in contradistinction to a fraction. Thus in the number 54.7, in decimal arithmetic, 54 is an integer, and 7 a fraction, or seven-tenths of a unit. In *arith.* and *alge.*, an integer, or whole quantity, with a fraction annexed to it, is called a mixed number, or mixed quantity; as, $9\frac{7}{8}$; $3a^2+\frac{2x}{y}$.

IN′TEGRAL, *a.* [Fr. from *integer.*] Whole; entire.

A local motion keepeth bodies *integral*. *Bacon*

2. Making part of a whole, or necessary to make a whole.—3. Not fractional.—4. Uninjured; complete; not defective.—*Integral calculus*, a branch of mathematical analysis which is the inverse of the *differential calculus*. In the differential calculus, the object is, to derive from a proposed function, another which is called its differential; and thence the expression which is termed its differential coefficient. In

the integral calculus the object is the reverse of this—the deriving of the primitive function from its differential, or its differential coefficient, and hence the elementary rules of the integral calculus are obtained by reversing those of the differential calculus. In this branch of analysis the primitive function is usually called the *integral* of the proposed differential, and the process is termed *integration*. An in tegral is said to be *definite* when its limits are given, and *indefinite* when they are not given. The method by which the integral of a proposed dif ferential quantity is to be found is, generally speaking, neither obvious nor capable of being reduced to fixed and general rules. When an integral is proposed, it may always be found by general rules, but there is no direct method of returning from the differential to the integral. The principal art employed in the integral calculus, consists in transforming the proposed functions into expressions which are known to be the differentials of given quantities. The integral calculus is applied to the finding of the quadratures, or areas, of curve lines, and their rectification, or the determination of the lengths of their arcs. It is also applied to the determination of the volumes and surfaces of solids; and it affords the readiest, and in general, the only means of determining the centres of gravity, of oscillation, gyra tion, &c. It is in fact the instrument by which mathematicians have suc ceeded in solving the difficult and important questions of dynamics and physical astronomy, and in ascertaining the laws which regulate the motions of the material world.

IN'TEGRAL, *n.* A whole; an entire thing. In *mathematical analysis*, the function or sum of any proposed dif ferential quantity. It is denoted by the symbol $\int$ (originally *S*, the initial letter of the word *sum*). Thus $\int X\,dx$, denotes the integral of the differential $X\,dx$, or the function whose differen tial is $X\,dx$.

INTEGRAL'ITY,† *n.* Entireness

IN'TEGRALLY, *adv.* Wholly; completely.

IN'TEGRANT, *a.* Making part of a whole; necessary to constitute an en tire thing. Those parts of bodies which are of a similar nature with the whole are termed *integrant parts*, or *particles*, as distinct from *elementary particles*. Thus filings of iron have the same nature and properties as bars of iron. Bodies may be reduced to their integrant parts by trituration or grinding, limation or filing, solution, amalgamation, and other processes.—*Inte grant molecule*, a term employed by Haüy in his theory of crystals, to denote the smallest particle of a crystal that can be arrived at by mechanical division. According to him, the *inte grant molecule* of a crystal has always one of these three forms—the tetrahedron, the triangular pyramid, or the parallelopiped. But Wollaston supposes the integrant molecules, or particles of crystals, to be spherical.

IN'TEGRATE, *v. t.* [L. *integro*.] To renew; to restore; to perfect: to make a thing entire. To *integrate a differential* in the integral calculus, is to determine from that differential its primitive function.

The entire, unimpaired state of any thing, particularly of the mind; moral soundness or purity; incorruptness; uprightness; hon esty. *Integrity* comprehends the whole moral character, but has a special reference to uprightness in mutual dealings, transfers of property, and agencies for others.

The skin of seeds and the shells of crustaceous animals are denominated *integuments*.

IN'TELLECT, *n* [Fr from L. *intellectus*, from *intelligo*, to understand. *See* INTELLIGENCE.] That faculty of the human soul or mind, which receives or comprehends the ideas communicated to it by the senses, or by perception, or by other means; the faculty of thinking; otherwise called the *understanding*. It is applied to the mind when only its rational powers are con sidered, apart from the animating principle, or the *will*, and from the seat and source of t'e passions. A clear *in tellect* receives and entertains the same ideas which another communicates with perspicuity. In the philosophy of Kant, the intellect is distinguished into two faculties, understanding and reason. The understanding, acting on experience, merely compares, judges, and measures its representations, and is conversant solely with their mutual limits and relations, classifying them according to certain schemes of its own which are called categories. While, however, the understanding is thus limited, the activity of the reason is unbounded, and as the principle of principles, it is the base and the verification of every special principle and reasoning. [*See* UNDERSTANDING.]

INTELLEC'TION, *n* [Fr. from L. *intellectio*, from *intelligo*.] The act of understanding; simple apprehension of ideas.

INTELLECT'IVE, *a.* [Fr. *intellectif*.] 1. Having power to understand.—2. Produced by the understanding.—3. To be perceived by the understanding, not by the senses.

INTELLECT'UAL, *a.* [Fr. *intellectuel*.] 1. Relating to the intellect or understanding; belonging to the mind; performed by the understanding; mental; as, *intellectual* powers or operations. According to Reid and Stewart, the most important of the intellectual powers are, consciousness, powers of external perception, attention, conception, abstraction, association of ideas, memory, imagination, the powers of judgment and reasoning. Besides these there are other more complicated powers or capacities, which are gradually formed by particular habits of study or of business; as, the power of taste; a genius for poetry, for painting, &c., with all the various intellectual habits acquired in the different professions of life. To this branch of our mental constitution may also be referred those auxiliary faculties and principles which are essential to our intellectual improvement, or very intimately connected with it; in particular, the faculty of communicating our thoughts by arbitrary signs, and the principle of imitation.—2. Ideal; perceived by the intellect; existing in the understanding; as, an *intellectual* scene. —3. Having the power of understanding; as, an *intellectual* being.—4. Relating to the understanding; treating of the mind; as, *intellectual* philosophy, now sometimes called *mental* philosophy.

INTELLECT'UALIST, *n.* One who overrates the understanding.

INTELLECTUAL'ITY,† *n* The state of intellectual power.

INTELLECT'UALLY, *adv.* By means of the understanding.

INTEL'LIGENCE, *n.* [Fr. from L. *intelligentia*, from *intelligo*, to understand. This verb is probably composed of *in*, *inter*, or *intus*, within, and *lego*, to collect. The primary sense of *understand* is generally to take or hold; as we say, to *take* one's ideas or meaning] 1. Understanding; skill.—2. Notice; information communicated; an account of things distant or before unknown. *Intelligence* may be transmitted by messengers, by letters, by signals, or by telegraphs.—3. Commerce of acquaintance; terms of intercourse. Good *intelligence* between men is harmony. So we say, there is a good *intelligence* between persons, when they have the same views, or are free from discord.—4. A spiritual being; as, a *created intelligence*. It is believed that the universe is peopled with innumerable superior *intelligences*.

To preserve the account of time, it is necessary that every fourth year should have 366 days, while the other years contain only 365. Hence, one of the months in the fourth year must have an additional day, which is called the *intercalary* day. The additional day was given to February as being the shortest month, and in the ancient Roman calendar was inserted between the 24th and 25th days. It is found, however, on examining the remains of ancient architecture that they rarely or never agree with the Vitruvian dimensions, which must therefore be regarded as arbitrary. In *Scots law,* an order of the court of session, or of an inferior court, pronounced on cause shown, for stopping any act or proceedings complained of as illegal or wrongful. The interdict is obtained in the court of session on presenting what is termed a bill of suspension and interdict to the lord ordinary on the bills. It may be resorted to as a remedy against all encroachments either on property or possession; and is a protection against any unlawful proceeding. In this bill the right of the complainer or petitioner is stated, and the act of encroachment or the unlawful proceeding, with the grounds on which the complainer applies for redress, are set forth, and the bill closes with a prayer that the proceedings may be interdicted until the question of right be tried in the proper court. In the course of the proceedings the propriety of granting an interdict will be discussed. But the decision on that point is quite distinct from the question of right, and an interdict may be granted in consequence of previous possession, though there be no ground to support an ultimate decision in favour of such possession. In the inferior courts the procedure is analogous, only the process commences with a summary petition to the inferior judge. [*See* SUSPENSION.]

INTERFĒRENCE, *n.* Interposition; an intermeddling mediation.—2. A clashing or collision.—3. A striking of one foot against the other.—4. In *optics,* a term first employed by Dr. Young to express certain phenomena which result from the mutual action of the rays of light on each other. When two minute pencils of light, radiating from two different luminous points, and making a small angle with each other, fall upon the same spot of a screen or a piece of paper, they are found to act upon each other, producing different effects, which depend upon certain differences between the lengths of the two pencils. In some cases the pencils illuminate the paper or screen more strongly than either would have done singly, and sometimes they destroy each other's effects and produce a black spot or fringe. This mutual action of the pencils on each other is termed *interference.* Arago and Fresnel have explored this subject to a great extent. The phenomena of the *interference* of rays have been explained in accordance with the undulatory theory of light, and are supposed to furnish a strong presumption in favour of that theory.

We know by *intuition*, that a part is less than the whole. *Encyc.*

Intuition is the most simple act of the reason or intellect, on which, according to Locke, depends the certainty and evidence of all our knowledge; which certainly every one finds to be so great, that he cannot imagine, and therefore cannot require, greater. In the philosophy of Kant, the term *intuition* is used to denote the single act of the sense upon outward objects, according to its own laws.

INTU′ITIVE, *a.* [Sp and It *intuitivo*; Fr. *intuitif*.] 1. Perceived by the mind immediately, without the intervention of argument or testimony; exhibiting truth to the mind on bare inspection; as, *intuitive* evidence. The different species of *intuitive evidence*, according to Dugald Stewart, are, 1. The evidence of axioms; 2. The evidence of consciousness, of perception, and of memory; 3. The evidence of those fundamental laws of human belief which form an essential part of our constitution, and of which our entire conviction is implied, not only in all speculative reasonings, but in all our conduct as active beings. Of this class is the evidence for our own personal identity; for the existence of the material world; for the continuance of those laws which have been found, in the course of our past experience, to regulate the succession of phenomena. Such truths no man ever thinks of stating to himself in the form of propositions; but all our conduct and all our reasonings proceed on the supposition that they are admitted. Every step which the reason makes in demonstrative knowledge has *intuitive* certainty; and, consequently, the power of reason presupposes that of intuition.—2. The action or operation of finding out something new; the contrivance of that which did not before exist; as, the *invention* of logarithms; the *invention* of the art of printing; the *invention* of the orrery. *Invention* differs from *discovery*. *Invention* is applied to the contrivance and production of something that did not before exist. *Discovery* brings to light that which existed before, but which was not known. We are indebted to *invention* for the thermometer and barometer. We are indebted to *discovery* for the knowledge of the islands in the Pacific ocean, and for the knowledge of galvanism, and many species of earth not formerly known. This distinction is important though not always observed.—2. That which is invented. The cotton gin is the *invention* of Whitney; the steam boat is the *invention* of Bell. Fables are the *inventions* of ingenious men.—4. In *painting*, the finding or choice of the objects which are to enter into the composition of the piece.—5. In *poetry*, it is applied to whatever the poet adds to the history of the subject.—6. In *rhet*, the finding and selecting of arguments to prove and illustrate the point in view.—7. INVERSE, *a.* (invers'.) [L. *inversus*. *See* INVERT.] Inverted; reciprocal *Inverse* proportion or ratio, is when the effect or result of any operation is *less* in proportion as the cause is *greater*, or is *greater* in proportion as the cause is *less*. Thus the time in which a quantity of work may be performed, will be *less* in proportion as the number of workmen is *greater*, and *greater* in proportion as the number of workmen is *less*. *If ten* men can perform a certain quantity of work in *six* days, then *twenty* men will perform the same work in *three* days. *Inverse* proportion is opposed to *direct*. [*See* RATIO.] Any two operations of algebra are said to be *inverse*, when one of them undoes, so to speak, the effect of the other; so that if both be successively performed upon the same quantity the result is the quantity itself. Addition and subtraction, multiplication and division, raising of powers, and extraction of roots, are instances of pairs of inverse operations.—*Inverse method of fluxions*, the method of finding the *fluents* of given fluxional expressions. It is the same with the integral calculus.—*Inverse method of tangents*, the method of finding the curve whose tangents are lines drawn according to some determinate law, or which fulfil some given condition.

INVERSELY, *adv* (invers'ly.) In an inverted order or manner; when more produces less, and less produces more; or when one thing is greater or less, in proportion as another is less or greater. Thus in uniform motion, if the velocity be increased, the time is diminished in the same proportion, the space being supposed to remain unchanged. Hence we say that the velocity is *inversely* as the time, or the time *inversely* as the velocity. The term *reciprocally* is often used in this sense instead of *inversely*.

Thus if $a : b :: c : d$; then, by inversion or invertendo $b : a :: d : c$.—7. In *geol.*, change of order or position, so that the upper may be lower, or the lower upper, the first last, or the last first. I'ODATE, *n.* [*See* IODINE.] Any compound of iodic acid with a base The general character of the iodates is similar to that of the chlorates. They form deflagrating mixtures with combustible matters, and on being heated to low redness, oxygen gas is disengaged, and a metallic iodide remains. The iodates are easily recognised by the facility with which their acid is decomposed by deoxidizing agents. None of the iodates have been found native. They are all of very sparing solubility, excepting the iodates of the alkalies. [*See* IODIC.]

I'ODIC, *a. Iodic* acid. An acid discovered much about the same time by Gay-Lussac and Davy, but the latter first succeeded in obtaining it in a state of perfect purity. It is formed by acting upon protoxide or peroxide of chlorine by iodine. It is also formed, according to Mr. Connell, by boiling iodine for several hours with about five times its weight of strong nitric acid. Iodic acid is a white semi-transparent solid substance, which is inodorous, but has an astringent sour taste. It is so dense as to sink in sulphuric acid. It is very soluble in water: it detonates when heated with charcoal, sugar, and sulphur. It combines with metallic oxides, forming salts which are termed *iodates*, and these, like the chlorates, yield oxygen when heated, and an iodide remains. Iodic acid is composed of 5 equivalents of oxygen, and 1 equivalent of iodine.

I'ODIDE, *n.* A non-acid compound of iodine with a metal or other substance. *Iodurelted iodides.* Hydriodic acid, and also the solutions of iodide of potassium and zinc, dissolve iodine, taking up a quantity of the iodine equal to that which they already contain. These compounds have been termed *ioduretted iodides*, or *hydriodates.*

I'ODIN, **I'ODINE**, *n.* [Gr. ιώδης, resembling a violet.] In *chem.*, a peculiar non-metallic acidifying and basifying elementary solid substance, discovered by Courtois, a manufacturer of saltpetre in Paris. Its peculiar properties were first ascertained by Gay-Lussac and Davy. Iodine exists in the water of the ocean and mineral springs, probably combined with sodium, in marine molluscous animals and sea-weeds. It has also been met with in combination with silver. The iodine of commerce is procured from the impure carbonate of soda, called *kelp* or sea-weed, which has been burned for the purpose of obtaining alkali from it. The incinerated kelp is lixiviated with water, and when the alkaline and other salts have been separated, the mother liquors are mixed with sulphuric acid and black oxide of manganese, by which the iodine is set free. At the ordinary temperature of the atmosphere it is a solid, apparently a simple substance, at least hitherto undecomposed. It is incombustible, but in combining with several bodies, it exhibits the phenomena of combustion; hence it has been considered a supporter of combustion. It is a non-conductor of electricity, and like oxygen and chlorine, is a negative electric. Like chlorine, it destroys vegetable colours, but with less energy. Its colour is bluish black or grayish black, of a metallic lustre. It is often in scales, resembling those of micaceous iron ore; sometimes in brilliant rhomboidal plates, or in elongated octahedrons. The specific gravity of iodine, according to Gay-Lussac, is 4.948; but Thomson found it only 3.0844. At 225° it fuses, and enters into ebullition at 347°. Its vapour is of an exceedingly rich violet colour, a character to which it owes the name of *Iodine.* This vapour is remarkably dense, its specific gravity being 8.716. Iodine has a very acrid taste, and its odour resembles that of chlorine. It is an irritant poison; but in small doses, and cautiously administered, it has occasionally been of great service in certain forms of glandular disease. It is very sparingly soluble in water, but dissolves copiously in alcohol and in ether, forming dark brown liquids. It possesses strong powers of combination, and forms with the pure metals,

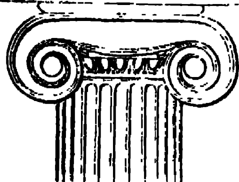
and most of the simple non-metallic substances, compounds which are termed *Iodides* or *Iodurets*; with oxygen it forms the *iodic acid*, and perhaps one or more oxides. Combined with hydrogen it forms the *hydriodic acid*. Starch is a characteristic test of iodine, forming with it a compound of a deep blue colour. This test is so delicate, that a solution of starch dropped into water containing less than a 450,000th part of iodine is tinged blue by it. The great consumption of iodine is in medicine; it is employed in its pure state, and in the form of iodide of potassium, sometimes called hydriodate of potash.

I'ODOFORME, *n.* A compound of 2 atoms of carbon, 1 of hydrogen, and 3 of iodine. It is analogous to *Chloroforme*, and obtained by a similar process.

IODOSALIC'ULIC ACID, *n.* An acid obtained by distilling iodide of potassium with chlorosalicylic acid. It sublimes in the form of a dark-brown fusible mass.

IODOSULPHU'RIC ACID, *n.* The name given to a crystallized compound of sulphuric acid and iodic acid. It is probably hydrated iodic acid.

I'ODOUS, *a.* *Iodous* acid is a compound of iodine and oxygen, containing less of the latter than *iodic* acid.



IOD'URET, *n.* A non-acid compound of iodine and a metallic or other base. Synonymous with *iodide*.

IOD'URETTED IODIDE. *See* IODIDE.

I'OLITE, *n.* [Gr. ιον, a violet, and λιθος, stone. A mineral of a violet blue colour, with a shade of purple or black, called also *dichroit* and *cordierite*. It occurs in regular six-sided prisms. Its varieties are peliom and steinheilite.

ION, *n.* According to Faraday, all substances susceptible of direct decomposition, by the electric current, are called *electrolytes*. Those elements of the *electrolyte* which are evolved at the *anode* are termed *aniöns*, and those which are evolved at the *cathode*, *cations*. and when these are spoken of together, they are called *ions*. Thus water, when electrolyzed, evolves two *ions*, oxygen and hydrogen, the former being an *aniön*. the latter a *cation*

ION'IC, *a.* [from *Ionia*.] *Ionic order*, one of the five orders of architecture. The distinguishing characteristic of this order is the volute of its capital. In the Grecian Ionic, the volutes appear the same on the front and rear; being connected on the flanks by a baluster-like form; through the external angles of the capitals of the corner columns, however, a diagonal volute is intro-

duced. The Romans gave their Ionic four diagonal volutes, and curved the sides of the abacus. The Greek volute continues the fillet of the spiral along the face of the abacus, whereas in the Roman, its origin is behind the ovolo. In the modern Ionic capital, the volutes are placed diagonally, and the abacus has its sides hollowed out. The shaft, including the base, which is half a diameter, and the capital to the bottom of the volute, generally a little more, is about 9 diameters high, and may be fluted in 24 flutes, with fillets between them; these fillets are semicircular. The pedestal is a little taller and more ornamented than the Doric. The bases used to this order are very various. The Attic base is very often used, and with an astragal added above the upper torus, makes a beautiful and appropriate base. The cornices of this order may be divided into three divisions, the plain Grecian cornice, the dentil cornice, and the modillion cornice. The best examples of this order are the temple on the Ilissus, of Minerva Polias, and Erichtheus in the Acropolis, and the aqueduct of Adrian at Athens; the temple of Fortuna Virilis, and the Coliseum at Rome The boldness of the capital, with the beauty of the shaft, makes it eligible for porticoes, frontispieces, entrances to houses, &c.—2. The *Ionic dialect* of the Greek language, is the dialect used in Ionia.—3. The *Ionic sect* of philosophers, was that founded by Thales of Miletus, in Ionia. Their distinguishing tenet was, that water is the principle of all natural things.—4. Denoting an airy kind of music The *Ionic* or *Ionian mode* was, reckoning from grave to acute, the second of the five middle modes.

IONID'IUM, *n.* A genus of South American plants, belonging to the nat. order Violaceæ. *I. parviflorum* is used by the Spanish Americans, and *I poaya* by the Brazilians, as a substitute for ipecacuanha. The *I. itubu* of Kunth is sold as true ipecacuanha. It is also used as a remedy for dysentery and gout.

IO'TA, *n.* [Gr ιωτα] Primarily the Greek *i*, which, in contractions, is often indicated by a sort of dot under another letter; hence, a little; the smallest quantity assignable. The word *jot* has the same meaning and origin.

IPECACUAN'HA, or **IPECAC'UAN**, *n.* An emetic substance, of a nauseous odour and repulsive bitterish taste, the root of several plants growing in South America. All the kinds have nearly the same ingredients, but differ

Ipecacuanha (Cephaelis ipecacuanha).

in the amount of the active principle which they contain, termed *emeta*, or *emetine*. The best is the annulated, yielded by the *Cephaelis ipecacuanha*, a small shrubby plant, native of Brasil, and of New Granada. Of this sort there are three varieties, namely, the brown, red, and gray, or gray-white, called also greater annulated Ipecacuan. As this is the only sort sent from Rio Janeiro, it is sometimes called Brazilian or Lisbon Ipecacuan. It is sent in bales and barrels. The root consists of a central axis called *meditullium*, and an external portion called the *cortical* part, in which the virtue chiefly resides. Of the three varieties of annulated ipecacuan, the brown contains 16 per cent. of emetine, while the red contains only 14 per cent.; the gray has not been analysed. Another sort of ipecacuan is obtained from the *Psychotria emetica;* this kind contains only 9 per cent. of emetine; and the undulated or amylaceous ipecacuan, the produce of the *Richardsonia scabra*, holds only 6 per cent. Besides these the roots of numerous other plants are used in tropical countries as emetics, and are often termed ipecacuan. The dust or powder of ipecacuan, applied to any mucous surface, causes irritation and increased secretion from the part. It is chiefly employed to excite the stomach either to augmented secretion, or to invert its action and produce vomiting. It is also capable, by being combined with other substances, of being directed to the skin, and producing increased perspiration. When given in very small doses, it improves the appetite and digestive powers; in a somewhat larger dose it acts on the intestines, but in a still larger, from 15 to 20 grains, it occasions vomiting.

IPOMÆ'A, *n.* A genus of tropical plants of the natural family of Convolvulaceæ, very closely allied to Convolvulus or Bindweed. Most of the species are ornamental; others are purgative, as the *I. jalapa*, or *purga*, the *I. cærulea*, the *I. turpethum*, &c. The latter probably derives its name from the Arabic *toorbud* (from Sanscrit *tri*, three, and *poota*, the coat of a seed); and is well known in India as a good purgative; having neither the nauseous taste nor smell of ordinary jalap. The bark of the roots contains the purgative principle. Six inches in length of a root of finger-thickness will furnish a dose. [For the *I. jalapa* or *purga*—*see* JALAP.] Recently, the number of plants long classed under the genus Ipomæa has been considerably reduced, by transferring them to other genera, to which they more naturally belong. Some have, for instance, been removed to Argyreia, Pharbitis, Quamoclit, &c. The *Batatas edulis*, or sweet potato, once ranked under the genus Ipomæa, is now the *Convolvulus batatas* of some authors.

They are principally natives either of the Cape of Good Hope or of the middle parts of North America and Europe. The Iris and Crocus are representatives of the predominant northern form of the order, as Gladiolus and Ixia are of the genera prevalent in the southern hemisphere. The species are more remarkable for their beautiful fugitive flowers, than for their utility The various species of Iris, Ixia, Gladiolus, Tigridia, Crocus, &c, are among the favourite flowers of the gardener.

IRID'IUM, *n* [from *iris.*] A metal of a whitish colour, not malleable, found in the ore of platinum, and in a native alloy with osmium Its specific gravity is above 18. It takes its name from the variety of colours which it exhibits while dissolving in hydrochloric acid The native alloy with osmium, or native iridium, is of a steel gray colour and shining metallic lustre. It usually occurs in small irregular flat grains, in alluvial soil, in South America. Iridium is of all metals the most infusible. it is brittle, and when carefully polished, has the appearance of platinum. When heated to redness in the air, if in a state of fine division, it is oxidized, but not if in mass. One of its most remarkable characters is the extreme difficulty with which it is acted on by acids; indeed, when pure it is probably insoluble; although, when alloyed with platinum, a little is taken up by nitromuriatic acid or nascent chlorine. Iridium combines with oxygen forming oxides, and with chlorine forming chlorides. These chlorides act as haloid salts and form iridio-chlorides with the basic chlorides. It has a considerable affinity for carbon.

The *I. florentina* or *orris-root* is used to make tooth and hair powder, and to keep up the discharge from issues. A few species, as *I. tuberosa, I. versicolor*, and *I. verna*, are cathartic. The seeds of *I. pseudacorus*, when roasted, form a substitute for coffee. The *I. pseudacorus* and *I. fœtidissima* grow wild in Britain, the first of which is known by the name of flag-flower, or flower de luce; and the latter by that of stinking iris.—7. The heraldic *iris*, is a symbol in coat armour; and in especial long held a place in our royal arms, from its being a badge of the kings of France, to whose throne the English monarchs set up a claim, now formally renounced.—

Iris (Heraldry)

Iris metal ornaments, such as buttons, are produced by engraving with an engine lines on the surface of the metals, of extreme minuteness, so as to divide a lineal inch into from 2000 to 10,000 equal parts These lines exhibit prismatic colours.

The radical elements of this word are not easily ascertained] 1. A metal, the hardest, most common and most useful of all the metals; of a livid whitish colour inclined to gray, internally composed, to appearance, of small facets, and susceptible of a fine polish. It constitutes, according to some, about 2 per cent. of the whole mineral crust of the globe. There is scarcely a rock without iron. It is so hard and elastic as to be capable of destroying the aggregation of any other metal. Next to tin, it is the lightest of all metallic substances, and next to gold, the most tenacious. It may be hammered into plates, but not into leaves. Its ductility is more considerable. It has the property of magnetism; it is attracted by the loadstone, and will acquire its properties. Its medicinal qualities also are valuable. The occurrence of iron in a native state is exceedingly rare; but there are few mineral substances in which its presence may not be detected. Such as contain it in certain forms and in sufficient quantity, are called *ores of iron*. Of these, some are worked by the miner for the sake of the iron which they contain; some for using in their native state; while others supply some principles useful in the arts or manufactures. Iron exists in nature under four different states:—the native state; that of an oxide; in combination with combustible bodies, particularly sulphur; and, finally, in the state of salts. The *cast-iron* of commerce is obtained by the ore being calcined, or *roasted*, and thereby detached from its more volatile impurities, and then exposed, along with certain proportions of coal or coke and lime, to intense heat in a blast furnace By the combination of these materials at a high temperature, the oxygen and earthy matter of the ore are separated from the metal, which by reason of its greater density collects at the bottom of the furnace, and is run off into moulds. This process is called *smelting*, and the iron in this state receives the name of *pig iron*. It is converted into *wrought* or *malleable iron* by a further process of purification called *puddling*. [*See* PUDDLING.] It then becomes known in commerce as *rod* or *bar iron*. Of the combinations of iron, steel is perhaps the most important. [*See* STEEL.]— 2. An instrument or utensil made of iron; as, a flat-*iron*, a smoothing-*iron*.

Two pendulums which vibrate in the same time are *isochronal*; also, the vibrations of a pendulum in the curve of a cycloid have the same property, being all performed in the same time whether the arc be large or small.

ISOCH'RONISM, *n.* The property of a pendulum by which it performs its vibrations in equal times.

ISOD'OMON, or ISOD'OMUM, *n.* [Gr. ισος, and δομη, structure] In *Grecian arch.*, a species of walling in which the courses were of equal thickness, and equal lengths.

ISODYNA'MIC, *a.* [from Gr. ισος and δυναμις, power.] Having equal power, or force

ISO'GRAPHY, *n.* [Gr. ισος, equal, and

γραφη, a writing.] The imitation of handwriting.

ISOE'TES, *n.* A genus of plants of the class Cryptogamia, Linn.; nat. order Lycopodiaceæ or Clubmoss tribe. The *I. lacustris*, or European quill-wort, is an aquatic plant, growing in the bottoms of lakes in the north of England, Wales, and Scotland.

IS'OLATE, *v. t.* [It. *isola*, an isle or island,] To place in a detached situation; to place by itself; to insulate.

IS'OLATED, *pp.* or *a.* [Fr. *isolé*; It. *isolato*, from *isola*, an isle.] Standing detached from others of a like kind; placed by itself or alone.—2. In *electricity*, the same as *insulated*.

IS'OLATING, *ppr* Placing by itself or detached like an isle.

ISOLA'TION, *n.* State of being isolated or alone.

ISOM'ERIC, *a.* Compounds consisting of the same elements in the same proportions, but with different properties, are said to be isomeric.

ISOM'ERISM, *n.* [Gr. ισος and μερος, a part] A term suggested by Berzelius, to designate the state of certain compounds, which contain the same elements in the same ratio, and yet possess physical and chemical properties quite distinct. The two cyanic acids are instances of this kind. They both consist of cyanogen and oxygen in the same ratio, and have the same equivalent, yet they differ widely in their chemical properties. A similar example is afforded by the tartaric and paratartaric acids.

ISOMET'RICAL PERSPECTIVE, *n* A new method of drawing plans of machines, &c., whereby the elevation and ground plan are represented in one view.

ISOMORPH'ISM, *n* [Gr. ισος, like, and μορφη, form.] 1. The quality of assuming the same crystalline form though composed of different elements, or proximate principles, yet with the same number of equivalents.—2 The quality of a substance by which it is capable of replacing another in a compound, without an alteration of the previous crystalline form of the compound.

ISOMORPH'OUS, *a* Having a different composition as respects elements, or proximate principles, (though not as respects number of equivalents,) but with the same crystalline form. Thus the phosphate and biphosphate of soda have the same form, or are *isomorphous*, with the arseniate, and biarseniate of soda; and in regard to other bases, such as potash and ammonia, each arseniate has a corresponding phosphate possessed of the same form. In these cases there is necessarily an analogy in the atomic constitution of the compounds, which are observed to possess the same number of equivalents of acid, alkali, and water of crystallization, and differ in nothing, except that the one series contains one atom of arsenic, and the other an atom of phosphorus.

IS'ONOMY, *n.* [Gr. ισος, equal, and νομος, law.] Equal law; equal distribution of rights and privileges.

ISOPERIMET'RICAL, *a.* [*See* ISOPERIMETRY.] Having equal boundaries; as, *isoperimetrical* figures or bodies.—*Isoperimetrical problems*, in *modern analysis*, a very extensive and difficult class of problems, the solution of which requires the application of a peculiar analysis. The general problem is as follows:—Among all the curves having the same length, to determine that of which some assigned property is a maximum or a minimum; for example, among all curves having the same perimeter, to find that which has the greatest area. This is the simplest question of the kind, and the curve to which the property belongs, is proved by elementary geometry to be a circle. Such problems are now solved by Lagrange's calculus of variations.

ISOPERIM'ETRY, *n.* [Gr. ισος, equal, περι, around, and μετρον, measure.] In *geom.*, the science of figures having equal perimeters or boundaries.

ISO'PODA, *a.* An order of crustaceans thus named from the formation of their feet, which are fourteen in number. This order embraces the genus Oniscus.

I'SOPODE, *n.* One of an order of the crustacea, embracing several genera.

ISO'PODOUS, *a.* Relating to an order of crustaceous animals.

I'SOPYRE, *n.* [Gr. ισος and πυρ, fire.] A mineral of a grayish or black colour, which occurs massive. It is found in Cornwall imbedded in granite.

ISOS'CELES, *a.* [Gr. ισοσκελης: ισος, equal, and σκελος, leg] Having two legs only that are equal; as, an *isosceles* triangle.

Isosceles triangle

ISOSTE'MONOUS, *a.* [Gr. ισος and στημων, a stamen.] In *bot*, having the stamens equal in number to the petals.

ISOTH'ERAL, *a.* [Gr. ισος, equal, and θερος, summer.] Of the same summer temperature; lines drawn through places having the same summer temperature are called *isotheral* lines

ISOTHERM'AL, *a.* [Gr. ισος, equal, proper, and θερμη, heat] Having uniform temperature or equal heat.—*Isothermal* lines, are lines drawn upon a map through a series of places having the same annual mean temperature. As the isothermal lines are as numerous as the places, and as diversified as numerous, geographers have grouped them into bands or zones, and called them *isothermal zones* Mrs. Somerville uses *isogeothermal*, instead of *isothermal*.

ISOTON'IC, *a* [Gr. ισος, equal, and τονος, tone] Having equal tones. The *isotonic* system, in *music*, consists of intervals in which each concord is alike tempered, and in which there are twelve equal semitones.

ISRAELI'TISH, } Israel.

IS'SUABLE, *a.* [from *issue*.] That may be issued. In *law*, an *issuable* term is one in which issues are made up.

IS'SUANT, *ppr.* In *her.*, issuing or coming up. It is used to express a charge or bearing rising or coming out of another charge or bearing, and also to express a lion or any other beast rising from the bottom line of a chief. *Issuant* and *revertant*, terms used to express a lion, &c., as if he were issuing or coming into the field in the base part, and going out again in the chief part.

Issuant.

IS'SUE, *n.* (ish'u.) [Fr. *issue*; It. *uscio*, a door, and *uscire*, to go out. It may coincide in origin with Heb. Ch. יצא, *yatsa*, Eth. *watsa*.] 1. The act of passing or flowing out; a moving out of any inclosed place; egress; applied to water or other fluid, to smoke, to a body of men, &c. We say, an *issue* of water from a pipe, from a spring, or from a river; an *issue* of blood from a wound, of air from a bellows; an *issue* of people from a door or house.—2. A sending out; as, the *issue* of an order from a commanding officer or from a court; the *issue* of money from a treasury.—3. Event; consequence; end or ultimate result. Our present condition will be best for us in the *issue*.—4. Passage out; outlet.

In *sur.*, a fontanel; a little ulcer made in some part of an animal body, to promote discharges.—8. Evacuation; discharge; a flux or running; Lev. xii.; Matt. ix. 9. In *law*, the close or result of pleadings; the point in dispute in a suit at law between two parties, ascertained by the pleadings. It is either an issue in law to be determined by the court, or, in fact, to be ascertained by a jury. In each form of action there was formerly a formal traverse, by which the whole or principal part of the allegations of the plaintiff in his declaration might be denied; this was termed the *general issue*. Since the adoption of the new rules of pleading (1834) there is now, properly speaking, no general issue, except in certain cases, where the privilege of giving special matter in evidence under it is given by statute. A *feigned* issue is a technical mode of trying some questions, supposing an imaginary wager. In the Scottish practice of trial by jury it is usual to put printed copies of the issues into the hands of the jurors. In *Scotland*, issues are either upon matter of law or upon matter of fact. Issues in law are pure questions for the determination of a judge, and issues upon matters of fact are tried by a jury.—10. A giving out from a repository; delivery; as, an *issue* of rations or provisions from a store, or of powder from a magazine.

IS'SUE, *v. i.* [It. *uscire*. *See* the noun.] 1. To pass or flow out; to run out of any inclosed place; to proceed, as from a source; as, water *issues* from springs; blood *issues* from wounds; sap or gum *issues* from trees; light *issues* from the sun.—2 To go out; to rush out. Troops *issued* from the town and attacked the besiegers.—3. To proceed, as progeny; to spring.

Of thy sons that shall *issue* from thee; 2 Kings xx.

4. To proceed; to be produced; to arise; to grow or accrue; as, rents and profits *issuing* from land, tenements, or a capital stock.—5. In *legal pleadings*, to come to a point in fact or law, on which the parties join and rest the decision of the cause.—6. To close; to end. We know not how the cause will *issue*.

IS'SUE, *v. t.* To send out; to put into circulation; as, to *issue* money from a treasury, or notes from a bank.—2. To send out; to deliver from authority; as, to *issue* an order from the department of war; to *issue* a writ or precept.—3. To deliver for use; as, to *issue* provisions from a store.

ISTH'MUS, *n.* (ist'mus.) [L. from Gr. ισθμος.] A neck or narrow slip of land by which two continents are connected, or by which a peninsula is united to the main land. Such are, the *Isthmus* of Panama, or Darien, connecting the two great continents of North and South America; the *Isthmus* of Suez, separating the Mediterranean from the Red Sea; with many others of note. But the word is also applied to land of considerable extent, between seas.

IT, *pron.* [Sax. *hit;* D. *het;* G. *es;* L. *id.*] 1. A substitute or pronoun of the neuter gender, sometimes called demonstrative, and standing for any thing except males and females. "Keep thy heart with all diligence, for out of *it* are the issues of life;" Prov. iv. Here *it* is the substitute for heart.—2. *It* is much used as the nominative case or word to verbs called impersonal; as, *it* rains; *it* snows. In this case, there is no determinate thing to which *it* can be referred. In other cases, *it* may be referred to *matter*, *affair*, or some other word. Is *it* come to this?—3. Very often, *it* is used to introduce a sentence, preceding a verb as a nominative, but referring to a clause or distinct member of the sentence. "*It* is well ascertained, that the figure of the earth is an oblate spheroid." What is well ascertained? The answer will show: the figure of the earth is an oblate spheroid; *it* [that] is well ascertained. Here *it* represents the clause of the sentence, "the figure of the earth," &c. If the order of the sentence is inverted, the use of *it* is superseded. The figure of the earth is an oblate spheroid; *that* is well ascertained. *It*, like *that*, is often a substitute for a sentence or clause of a sentence.—4. *It* often begins a sentence, when a personal pronoun, or the name of a person, or a masculine noun follows. *It* is I: be not afraid. *It* was Judas who betrayed Christ. When a question is asked, *it* follows the verb; as, who was *it* that betrayed Christ?—5. *It* is used also for the state of a person or affair.

> How is *it* with our general? — *Shak.*

6. *It* is used after intransitive verbs very indefinitely and sometimes ludicrously, but rarely in an elevated style.

> If Abraham brought all with him, it is not probable he meant to walk *it* back for his pleasure. — *Ralegh.*

> The Lacedemonians, at the straits of Thermopylæ, when their arms failed them, fought *it* out with their nails and teeth. — *Dryden.*

A cutaneous disease of the human race, appearing in small watery pustules on the skin, accompanied with an uneasiness or irritation that inclines the patient to use friction. This disease is supposed by some authors to be occasioned by a small insect, a species of Acarus, as the microscope detects these insects in the vesicles. Others suppose the pustules only form a nidus for the insects. The itch is cured by sulphur, which should be given internally, and applied externally in the form of ointment. This disease is taken only by contact or contagion.—2. The sensation in the skin occasioned by the disease.—3. A constant teasing desire; as, an *itch* for praise; an *itch* for scribbling.

I'VORY, *n.* [Fr. *ivoire;* L. *ebur.*] The name given to the substance composing the tusks of the elephant and the walrus, and to the horn of the narwhal or sea-unicorn. The tusks of a full-grown elephant sometimes grow to be six or seven feet long, but the medium weight of a tusk is about 60 lbs. Elephants' tusks are hollow from the base to a certain depth, the hollows being filled with medullary matter. The solid portion is of an intermediate substance between bone and horn, and contains about 24 per cent. of gelatine; it is readily distinguished from bone by

its peculiar rhomboidal net-work, shown when the ivory is cut transversely. The hardest, toughest, and most translucent ivory is reckoned the best. As a material, it is extensively used in the arts for making or embellishing numberless small articles in almost universal use.

I'VORY, *a.* Consisting of ivory; as, an *ivory* comb.—*Ivory dust*, the borings and chips of the ivory-turner.

I'VORY-PALM, *n.* The tree which bears the ivory-nut.

I'VY, *n.* [Sax. *ifig*; G. *ephen*.] An epiphytic climbing plant of the genus Hedera, the *H. helix*, class and order, Pentandria monagynia, Linn., nat. order, Araliaceæ. The leaves are smooth and shining, varying much in form, from oval entire to three and five lobed; and their perpetual verdure gives the plant a beautiful appearance. The flowers are greenish and inconspicuous, disposed in globose umbels, and are succeeded by deep green or almost blackish berries. The *H. helix*, or common ivy, is found throughout almost the whole of Europe, and in many parts of Asia and Africa. It is plentiful in Britain, growing in hedges, woods, on old buildings, or rocks, and trunks of trees. A variety, called the *Irish ivy*, is much cultivated on account of the large size of its foliage, and its very rapid growth.

> Direct the clasping *ivy* where to climb.
> *Milton.*

The ivy attains a great age and ultimately becomes several inches thick and capable of supporting its own stem. The wood is soft and porous, and when cut into very thin plates may be used for filtering liquids. In Switzerland, and the south of Europe, it is used for making various useful articles. The ivy has been celebrated from remote antiquity, and was held sacred in some countries, as Greece and Egypt.

I'VYED, *a.* Overgrown with ivy. [*See* IVIED.]

I'VY-GUM, *n.* A resinous juice, which exudes from the stem of the ivy-tree, (*Hedera helix*), in warm countries. It is imported from the East Indies, in compact reddish masses.

IX'IA, *n.* In *bot*, an extensive genus of Cape bulbs, class and order, Triandria monagynia, Linn., nat. order, *Iridaceæ*. The beauty and elegance of the flower procure for it a high place among ornamental plants. Its name is derived from a supposed resemblance borne by the flower to the wheel of Ixion

IXI'ON, *n.* In *anc. myth*, a king of Thessaly, married to Dia, whose father Deioneus he cruelly murdered, and was therefore shunned by all his fellow-men. Jupiter, moved with pity at his forlorn state, translated him to heaven; where he nevertheless attempted to seduce Juno. To entrap him, Jupiter fashioned a cloud into the shape of Juno; which, Ixion having embraced, thence sprang the Centaurs. For this treachery he was struck with thunder, and banished from the society of the celestials; one of whom (Mercury) was ordered to tie him to a wheel in hell, which continually whirled round, and the punishment of Ixion thus became eternal.

IXO'DES, *n. plur.* In *entom.*, a subgenus of acari, vernacularly named *ticks*, found in thickets plentifully in warm and dry seasons, which fasten on and torment oxen, horses, dogs, and other quadrupeds.

I'YNX, *n.* In *ancient myth.*, the daughter of Pan and Echo. She inveigled Jupiter into his intrigue with Io. As a punishment, Juno changed her into a bird, called the *wry-neck* (*Iynx torquilla*), which still possessed the power of exciting love; hence the iynx became a part of the love-spells among the Greeks. Latterly, the signification of the word *iynx* became different; and it was extended to every charm in poetry and music. In this sense, the iynx went under the name of the nightingale; and it is thus represented on the monument of Sophocles, and in the temple of the Pythian Apollo.

IZA'RADAS, *n. plur.* In the *East Indies*, the name of middlemen, who collect land revenue from the native cultivators, and pay it to the British authorities.

A GENERAL DICTIONARY OF GEOGRAPHY, PHYSICAL, POLITICAL, STATISTICAL, and DESCRIPTIVE, including Comprehensive Accounts of the Countries, Cities, Principal Towns, Villages, Seas, Lakes, Rivers, Islands, Mountains, Valleys, &c., in the World. Now Publishing in Parts, 2*s.* 6*d.* each. A companion to the "IMPERIAL DICTIONARY."

It is the purpose of the IMPERIAL GAZETTEER to supply such a Work as the circumstances of the present age require. In its compilation, *the most recent and authentic sources* will be consulted, and particular attention will be paid to the Trade and Resources of the various places described, and to the Social Condition, Manners, Customs, &c., of the Inhabitants. Great care will also be bestowed on the Physical Geography of Countries, in the various departments of Geology, Hydrography, Climatology, Botany, Zoology, &c., and on the laying down of geographical positions and relative distances.

These Illustrations will comprise Views of Cities and Towns; of Remarkable Buildings, Antiquities, Natural Scenery, Costumes, Plans of Ports and Harbours, and Small Maps of River Mouths, Islands, and Island Groups, &c., on an enlarged scale.
